Another trick is to flush the receiving converter and the entire front end of the modem and feed the 10.7 MHz IF of your Icom R-7000 directly into the high IF of the modem. That way you can tune it anywhere you want. (Tnx to Richard Bisbey for that idea!)

After the holidays are over, I'm thinking of ordering another DSY modem from GRAPES; I plan to modify it so that it works as a full-duplex repeater (i.e., transmitter clock is derived from receiver clock) and put it on a hill locally with a 433 MHz input and a 905 MHz output. The beauty of this scheme is that no in-band duplexer is required, and people who are currently using 433 MHz simplex can add a $50 converter (yeah, Hamtronics) to convert the 905 to the 433 MHz channel they've been using all along.

Well, according to both Heath Technical AND AEA, they are the same unit
internally. I know that my friend's PK-232 and my HK-232 sure look like
the same thing externally. Heath and AEA also both agree that the update
SHOULD work. I'm going to find out.....

When I get it, I'll post the results, unless someone else beats me to it.

RE DSY MODEMS:

I spoke with John, WA9SOU last night. John is a TV engineer. He believes it would be easy (for him anyway) to multi-couple a few xverters on the same antennas.. 'If everthing is linear, it should work' . I'm no genious but HE feels that it's a rather simple task (money, time asside) to balance/ mix the signals onto common antennas. I said ' kinda like CATV directional couplers? ' He said 'yes, kind of'.. He was very impressed with the flexibility inherent in the design. (by common antennas, I mean sharing an antenna with more than one rx converter or Xverter).

John also stated that he knew (as I do) that we will need the 'headroom' soon enough. He already has visions of multi-coupled nodes (mostly duplex) spanning the state.

For my money, it sure beats the pants off trying to make a VOICE radio squirt 20Khz wide DATA out at 9600 b. (e.g., PACCOMM 9600 & Etc..)

Correct me IF I'm wrong. Can you not run a DSY modem in full duplex mode, WITHOUT a PC/TNC some how?? I suppose you'd still need a method of Identification for the FCC.. I confess, I haven't thought this all the way through.

Brian, I was one of the ones that was pointing out what I felt were

some of the reasons holding back the development of "higher" speed
packet development. My point in saying what I did was not to start
a fracas or lament the demise of experimentation in ham radio per
se, but to simply point out what I felt were the facts in the situation.
I do not think that your rebuttals below are really realistic. They
may all be TRUE :-) but I don't think they really address the problem.
Now my comments in REVERSE REVERSE order.

>>2. Money
> $500 for a 56Kbit modem, transmitter, receiver, and antenna
>   must be more than most can afford.

Ok, figures vary... but let me tell you what I have to do here.

Hard-line for 500 foot tower. 1/2 inch for around $1.25 per foot or 7/8 inch
for around $4.00 per foot. If you are going to go UHF, you better figure on
7/8", so that is $2000 plus connectors at $50 per.

Antenna: You are not allowed to put junk on a commercial tower. Figure worst
case is a DB-224 at around $650. Cost drops for 220 or 440 MHz.

Two TNCS's at $120 per plus mods. Two radios... cost.... "whatever".

Amplifiers: (long way between towers in this area) Figure around $300-$500.

Duplexer Bp/Br: ... good one costs around $1000.

Bandpass cavities to get rid of crap that duplexer did not...around $250 per.

Power Supply: Figure around 50 amps or so. $200 for Astron RS-50

Ok, so now I have all of the above (which I do) and you are telling me to
go out and build the DSY modem. Now I need.

The modem:
Linear Transverter:
2 TNC's (I can reuse the old ones)
IBM PC What happens to the people that have tower mounted their equipment?
        Do you run a PC on a tower at 1200 feet that vibrates like a banshee
        and has extreme temp. variations?) If the DSY modem or support gear
        has a problem, then I have to "ride the elevator" and try to adjust
        it on the tower? I have to schedule the trip up the tower two weeks
        in advance so I need to have ready spares. Cost? Feasibility? This
        is why my stuff is on the deck and bit the bullet on the hard-line,
        but there are many out there that put the gear on the tower.

Cross band couplers (for the new band the DSY modem is going to be on) Or new
                    hard-line......

New Antenna

I already have THOUSANDS invested in the node site Brian. I do not think the DSY modem can be installed here for $500. in fact I laugh at the notion of that thought. Maybe your figures apply somewhere is the world but I am afraid they are grossly unrealistic here. It raises my hackles when you say that all we have to do is go out and spend $500 and POOF...instant 56 KBS.

>>1. Knowledge
>   When you've decided there's nothing more for you to learn,
>   you've decided it's time to die.
>"I tell you Wilbur, and I tell you Orville, that thing will never fly!"

No one says 56 KBS won't work, it just takes some knowledge to get it up and running. What happens when you put it together and it just sits there and looks at you? Now what? You have to figure out just where the problem is... is it the "interface TNC"... the DSY modem... software in the PC... in the EPROM that you burnt for the TNC..... is there something weird in the RF segment? You don't figure this out with a Simpson 260 and OHMS LAW. You need test equipment, knowledge, time, and some more money. It's really hard to pull off all those requirements in short order for each and every geographic site. Am I a "slacker" for saying that I just can't attempt that for more than just my area? I.E. I can't build and perfect 15-25 sites throughout the state.

>>3. Time
>   Yup, lots of retired hams haven't got the time to do anything
>   in between their morning and afternoon naps. Guess we young
>   folks will have to stay up until two in the morning.

That's a pretty hard blow Brian. I am not talking about "the retirement folks", (that live on a fixed income and are trying to just get by) I am talking about the guys that work 9 to 10 hours a day, and are fixing all the gear for the local hams already, AND maintaining the clubs voice repeater AND trying to get packet going in the area. Time starts becoming critical. The time it takes to build and debug the DSY modem, plus learn how to do so in the first place becomes a significant factor. Something has to give and it would help a lot of I could just buy the darn thing and know it was going to work perfectly and learn how to fix it when it breaks. :-)

>Seriously, folks, the major reason packet radio is still at 1200bps is
>because faster stuff isn't available off-the-shelf at Ham Radio Outlet
>and their ilk. But innovation doesn't require a crowd; history is full
>of lonely men and women coming up with great things on their own. Why
>not strike out just a bit on your own and see?

Innovation does not require a crowd, but unfortunately building a state-wide network does. Getting a crowd of innovative people working together is one of the biggest challenges of packet radio. We don't need people striking out on their own to solve the immediate problems that we face. We need people that pull together and invest the TIME and MONEY to pull it off. Hopefully those same people are capable of obtaining the knowledge.

>Is this attitude why the U.S.A. is becoming a nation of lawyers and clerks,
>instead of inventors and engineers?

What "attitude" are you talking about? The fact that I feel that it is too hard to build each node site from a kit instead of being able to just buy and install it? I am facing reality Brian, I am working with every person in this state to try and get moving. The problems that I have discussed are not "theoretical" but are the real ones that I am experiencing. Don't "shoot the messenger" just because the news that he carries is not good.

>C'mon! We can do it alone, but we can do it SOONER if more than just a
>few help.

Agreed...totally! But we could do it a lot faster if we could buy a unit that is guaranteed to work out of the box, ready to go... just plug it in and turn on the power...and if it costs $200 more for that kind of performance....no sweat! In my opinion the DSY modem still REQUIRES innovative skills, talent, knowledge, and money. These requirements exist in the Amateur world but not in the quantity it takes to put up a network across the state, let alone across the country. The proof of that is staring us right in the face. Phil's answer of licensing the DSY design and trying to get it commercially produced is the best darn thing I've heard! If there is something that we can all do to help in that regard, THAT'S what I am looking for! You tell me what I and others can do to help there, and I for one promise to do it.

 Having built up a DSY modem over a year ago I feel people need to know
that not all that much labour is required to get one on the air.
It seems the biggest problem is finding some one else in your area who is

also willing to experiment.
Given that you can find a local ham who is running NET (you *have* to run kiss in your tnc-2, TAPR fimware is too slow) and you can lay your hands on a transverter to take the DSY's 28Mhz output up to 220Mhz or 430Mhz, you are looking at a 2 week job of a couple of hours a night to populate the 3 circuit boards for the modem, make some well documented mods to your tnc-2, drill and file some holes in a box for the modem, make up some interconnecting cables.
The modem requires a scope to align but again the GRAPES guys have done a really good job on the documentation and the procedure is VERY straight forward.
Of course if your into "advanced" experimenting then you might want to wait for the K3MC I/O card which DRSI is going to be selling, in the mean time a modified tnc-2 works well, I even got mine working at 56kbps between the tnc & my Mac!
Please note that I do NOT consider myself an advanced experimenter and I am sure that anyone who has gotten a modest sized Heath kit working and can follow written directions would have NO problems putting a WA4DSY modem on the air. In fact the Grapes guys claim that the modem will pass the loop back test BEFORE you align it! They peak the coils for the rf board when they manufacture them which leaves them within the design spec for the modem. Of course you should still do a proper alignment.
BTW, we here in Ottawa should have our 56Kbps REPEATER on the Real Soon Now..

> much less attractive.

I assume that by "connection for an external modem" you mean the modem disconnect header. Lacking this is not a problem, since the DSY modem does not connect to it anyway - it does not provide all the signals needed, and in particular lacks an input for an external tx clock. You must connect the modem to various points on the TNC board... this will involve some track cutting, but it should be possible to make it work with any TNC that uses the SIO or SCC (8530) chip. However, in order to run KISS-56, your TNC must be "firmware compatible" with the TNC-2. Your clone should be ok (I hope it's one licenced by TAPR!), but the PK-88 may not be. GRAPES provides source to KISS-56, so you could hack it if necessary. If you are planning to use the modem with PC compatibles, you are probably better off to forget the TNC idea and instead get the K3MC board. It should be available from Pac-Comm by the time you get your modems built.

I suspect we have vastly differing goals in mind here. I want to BUILD
a high-speed digital network, whilst I think you want to HAVE one.

If the entire idea were to only USE a high-speed ham radio network, we
could just go out and buy one. Point-to-point highspeed digital radios
are easy to get; they're just sorta expensive. Router nodes are easy
to get - there are lots of 11/23s that can run the FUZZ software, or
just buy a C/30 from BBN - again, expensive, but an off-the-shelf
solution. Another question then is why to have it a ham radio
network? We could commercially license it, list every ham in creation
as a member of the corporation that would have to be formed to buy and
manage the thing, and we'd have no restrictions on content to boot!
But that's not what I want to do. Nor, strangely enough, I suspect, do you.

In large part, the challenge to me is in building the network: Seeing
what we can do with the materials at hand. Stretching the state of the
art. And a good part of the challenge is to see what it takes to do it
at a price where most hams can afford to participate. That's the reason
why the IBM-PC was the software development base, although in truth it's
a slow, cranky and poorly designed piece of last-decade's iron. That's
why the TNC exists. That's why packet got started using 202 modems over
voice radios. But we can move beyond those now, cheaply.

Admittedly, I'm torn between the two opposing goals of having a my cake
and eating it too: the challenge of building the network and the
challenge of making good use of it when we have it.

Dale Heatherington came up with a brilliant step forward when he
designed the 56KB modem; other people are making strides to even faster
links. This is the sort of thing that makes ham radio live for me; I

suspect I'll be bored with the network after we've built it if we can't keep making improvements in it. A package solution just isn't for me.
     - Brian

PS: Your prices are probably realistic for new stuff bought over the counter; I wouldn't do it that way but if you do that's probably close to what you'll pay. A few points, however: most commercial mountaintop sites nowadays use multicoupled antennas; you don't need an antenna, hardline, or duplexer because you'll be using the multicoupler. Your transmitter will need a cavity and a circulator to shoot into the multicoupler, especially if it's a ham grade device, since most ham gear has a pretty filthy spectrum compared to commercial grade gear, The IBM-PC doesn't have to be tower mounted; you can run the digital stuff up the tower to the radios - that's a whole lot safer for the technicians like me who have to climb the damn thing, since you won't be running 115vac mains up there for me to stick my icepick into when I'm trying to chip my way through the nine inches of radial ice.... I wouldn't put an Astron on a mountain; they're insufficiently cooled for that sort of duty. Most mountaintop sites around here have massive 12-volt building supplies anyway, typically batteries floating on a line charger and/or photocells, so you don't need to spend that either. The one we have one of our remote bases in at 9000ft has 1200amp-hours of 13.5v on float and we just hook into the busbars. We have a DB-413 antenna up about 75ft on the main tower for transmit, and we receive off the multicoupler, plus we have independent antennas for the two meter and six meter remote stations. The controller is a wire-wrapped Z80 widget and the whole thing has been running in place for almost 10 years now.

     All right, guys, enough of the talk about who is the better ham for the moment. I'm not a ham, simply because I haven't had any incentive that I felt was sufficient until now. With the availability of 52kbits, I'm again considering. But I want someone who knows to

tell me exactly what I would need to get into this enterprise.

Right now, I have a computer and software. I don't have a license, modem, antenna, radio, or anything else which might be needed. If it's justified, I'm willing to hit the books and get the necessary knowledge (I have a technical background already), but I want to know what I will need in equipment before I can make the economic decisions that have to precede any endeavor of this sort. So e-mail or post, whichever you think is reasonable, and tell me what I need to do to get a 56kbits packet station on the air. This may seem a little arbitrary, but I've gotten into things before with a lot of time and money and been disappointed, and this group seems like a good place to turn for this sort of info.

Bill.

Has anyone out there used the MFJ-1278 Multimode Data Controller ? The ad in QST says it has 9 modes, two more than the PK-232. What is your opionion of this unit ? For the list price of 279.00, its 30 bucks cheaper and seems to have more features. Well, hams, what say ye ?

Please email, and I will post a summary.

Bob, N4CDO

In this area, the retired hams have been doing a yeoman's job of
handling the affairs of GRAPES. Not only have they contributed to
the extent of their technical abilities, they've completely taken over
such mundane tasks as responding to inquiries about our Modem Kit,
parts procurment, newsletter publication and numerous other mundane
matters of business. Many of these things simply were not getting done
when the technical wizzards were trying to multitask. Yes, many of these
guys, young and old, lack sophisticated technical skills but the
hard core technical aspect is about 5% of building a network. I'd estimate
that a good 50% is plain old fashioned politiking. The rest is grunt work.

>
>>2. Money
> $500 for a 56Kbit modem, transmitter, receiver, and antenna
>   must be more than most can afford.

Why don't we take a bit closer look at costs, particularly for a switch
since user modems are of little use without a highsite switch. I'm assuming

a 4 port switch (1 56kb, one LAN port, one 1200 baud 145.01 backbone link, and one dialup control port). Some particulars:

1	286 PC with 1 mb ram and a 10 mb hard drive	1,500.00
2	async boards	60.00
1	modem kit	250.00
1	transverter	275.00
1	set, modem case, cables, px, etc.	100.00
3	TNCs (optimistic price, assumes club discount)	300.00
2	VHF radios (again, optimistic used prices)	300.00
1	UHF Super Stationmaster (we only got about 3 watts at the antenna)	600.00
1	VHF Super Stationmaster (for user lan)	600.00
1	VHF vertical	100.00
1	set, hardline and connectors	200.00
1	12 volt, 35 amp power supply	150.00
1	UPS	200.00
1	phone modem	100.00
1	Phone line for a year	250.00
Misc expenses (cabling, cabinets, etc)		100.00
		========
		5,085.00

Coincidently, we allocate about 5 kilobucks per site for planning purposes. I don't know about Brian, but that's big bucks for me. And of course, I have not figured in the cost of a tower. I assume one to be available (not true at 2 of our sites).

Then we have to get back to the time issue. It takes a LOT of time to build a switch, especially when you don't have the space luxury of a 19" equipment rack. I'd say that it takes a good 3 man-months of spare time to build, package, burn in and install a switch.

>>1. Knowledge
> When you've decided there's nothing more for you to learn,
> you've decided it's time to die.
>

How 'bout when you get to the stage when you no longer care to teach others? I'm particularly addressing the state of NET/NOS at the moment. I've personally long since given up on wasting my precious spare time RTFSC to try to figure out the latest hack in NET. Some of us are not yet network whizzards and need the clues contained in the minds of the coders.

>"I tell you Wilbur, and I tell you Orville, that thing will never fly!"

>of lonely men and women coming up with great things on their own. Why
>not strike out just a bit on your own and see?
>

>Is this attitude why the USA is becoming a nation of lawyers and clerks,
>instead of inventors and engineers?

Perhaps more accurately, we're becomming a world of net.bitchers instead of doers. We don't need inventors and engineers to build networks. We need worker-bees. And in fact, the worker-bees abound. The problem is that with insider knowledge to direct each step.

Let's look at some REAL problems:

1. Networking equipment is not yet off the shelf at HRO or whatever your favorite ham store is. This is a REAL PROBLEM. It was fun building the first modem. It was even enjoyable building the 2nd. But by the time you build 5 or 6, it becomes a real pain in the ass. We've almost resorted to drawing straws for GRAPES modems.

   We've done the development work, now I want to buy off the shelf. I'd love to see our DSY modem in a turnkey node. Anyone that is really interested in this problem should inquire of ALL the packet vendors why they keep demanding exclusive, proprietary rights before producing harwdare. Guess they never heard of standards like, for instance, the TNC-2?

2. RF gear is hard to come by and expensive. The Microwave Modules transverters which work best with the DSY modems are expensive and hard to get. I pestered the guys at Down East Microwave for 6 weeks to get mine. Seems like the chaps at Microwave Modules make transverters only when the urge hits.

   There are some local efforts at transverter design but it seems that there is a cruel comspiracy of work demands, equipment failure, and the small detail of a family life that gets in the way. You'd think that somewhere in this country someone could make a 10 meter to 430 transverter on a single board that would mount with the modem in a compact case. C'mone you RF gurus. Give us some watts. Not at 902 or above but at 430 where commercial antennas, duplexors, and test gear is reasonably available.

3. The digital side of networking sucks. The DSY modem works like a dream. If the squelch opens on a signal, it will decode. Truely amazing if you're used to 1200 baud FSK channels. But from the modem on down, the situation is dismal. The best we can do reliably from an unloaded PC is 19.2kb. Even that is not terribly reliable. There are still sufficient problems in NET/NOS that net thruput is typically below 200 cps. I say NET/NOS because we're still running pre-NOS on the switches. Our only attempt at NOS resulted in a crash'n'burn. Works fine on user machines but MTTC on a 4 port system is measured in seconds.

   I know that faster hardware is in the pipe but if one plants his feet down here and now and reviews history to this point, the digital side of things is a big sore thumb.

4. Documentation for NET/NOS. Simply put, even sophisticated users are put off by the current state of tcp/ip. I've always believed that what separates engineering from hacking is the paperwork. This package, no matter how much work phil and others have put into it, is a hack. I have no other way to bring a new user up other than to spend hours handholding. And usually a trip or two to his shack. We simply must do better than this if we are to be taken seriously. Please understand that this is a plea based in frustration and not anger. I want to see IP-based networking fly but is simply will not now. Please, let's take some time out from coding and document a bit. Routing and name servers and all the other neat stuff under development is not worth diddly if the users cannot make it work.

   It was OK 4 years ago to say that it was experimental code and not suitable for users. It might even be OK now except that Brian and others are flaming people for not building production systems from this stuff. It can't be both ways.

5. Cost. 5 Kbucks per switch and close to 1 Kbucks for a user is pretty rough. I had to scheme quite a bit in order to build my modem. That's the most expensive piece of ham gear I've ever had. The only way GRAPES could afford to build switches is through the sale of modem kits. I really don't see how a club without a project can do it.

6. Critical mass. This is most often overlooked. By critical mass, I mean there being enough hams operating a new mode to make it worthwhile. With TNCs, that was easy. Most any ham can pinch a C-note without consulting the war department (spousal unit :-) A 56kb modem is a whole 'nuther matter.

   I know that critical mass is a problem even here. When I built my modem, there were perhaps 3 other full time stations on and maybe a half dozen other part timers. I asked a rhetorical but very real question to the effect that after we all download each others' hard drives, what more is there to do with the modems? Sure someone can wisecrack that we could do voice mail or something like that. The problem is that this takes even more work and reduces the pool of critical mass candidates even more. When I could not give an answer to this question and when I saw my system idle for days at a time, I sold the modem. I'll probably get something high speed again someday when more hams are on but it was a waste of money at the time.

7. Time. We've already addressed this one but I want to mention it again to emphasize how the time factor drives things here.

8. Politics. Putting a statewide network together has been and continues to be an ongoing political battle equivalent to any elected office. The job is, of course, to convince all the little kinglets in the fiefdoms around the state that the GRAPES effort is not an attempt to horn in on local authority. We supply trunking equipment and technical guidance if desired. We've been successful

but the quest continues.

9. Lack of a pressing impetus to change. In other words, the applications our users want do not necessarily require higher speed. Most traffic would fit much better into the Usenet news model with Email tacked on the side than in the IP 3 function model. User, typically not being visionaries, don't look beyond the present. they depend on us techies. And what we're pushing right now - high speed versions of the same old stuff - is not exciting enough to motivate most users to change. Sure I can talk about digital voice and FAX and pseudo-realtime video and the like but if the likelyhood of it appearing in the next couple of years is not real, the user listens with curiosity and then continues on with the old reliable stuff. This is plain old human nature.

This has gotten quite long so I'm stopping now. I hope this post is taken in the spirit it is offered. I'm not trying to criticize anybody. I'm trying to get things off top dead center. We should not criticize users for things beyond their control nor for not jumping onto the first fast bandwagon down the pike. I guess we're learning the same lesson many high tech businesses learn the hard way - that implementing a new technology takes many times more time and effort than anyone could predict.

You hit the nail on the head. We (the YCCC) run a 10 node PacketCluster
system covering Maine to NY that normally has 100 or more users connected.
We use 144.91, 144.93, 144.95, 144.97 144.99 for the nodes and 221.07
for the backbone. We would LOVE to put together a fast, reliable backbone.
The current backbone is already hitting the usual hidden transmitter
problems. By spring we expect to have a super backbone of, at most, 4
nodes running 9600 baud or more. The real question is, what will the standard
be, and when can we buy it off the shelf? The main couple of guys
doing the work are also very busy with other projects and can't even
consider doing pioneering work in the packet field by themselves.

For the record: 1200 baud Bell 202, ax25 packet only sort-of-works. It
definitely does not work very well for the master-slave, server-client
PacketCluster type application. We normally see good performance for up
to 5 simultaneous users on a node. At 10-15 users we start seeing guys
retry out after DX spots. At 25 users, stations are constantly dropping
out. I would support, and be willing to contribute to, an effort to
implement a variant of ax25 for use as a master. Slaves would run standard
ax25 while the masters would expect to have no peers and be allowed to
deviate from the ax25 spec. Any takers?

But that spoils the fun, which would be to plug it into the existing
PeeCees. Inside their noise chambers.

My guess is that you'd have to install the front end right at the BNC
connector end of the board (or drive bay enclosure), feeding a metal
shield soldered around the front end circuitry on a 2-layer (or more!)
PC board. That would have synthesizer inputs and IF outputs, both
at a high enough level that the PC noise wouldn't clobber them too
much.

Or, if one used disk drive mounting, the drive bay would house the
front end and IF strip, all mounted inside an RF-tight enclosure with
coax going to the modulation board on the PC bus.

It reminds me of how a mathemetician catches a lion: Build a cage,
invert it, and the lion will be inside it (along with the rest of
the world). Build an RF-tight enclosure inside the PC's RF-tight
enclosure, to shield out the noise. Then you have the radio outside
of the box noise, even though it's inside the box.

Hamtronics boards, or dissected HTs, might be a way to find small
enough RF strips.

Phil,

We'd LOVE to see the DSY modem as a commercial product. The problem is that EVERY DAMN VENDOR that has approached us that I'm aware of (and I do spend a lot of time on the sidelines these days) had demanded EXCLUSIVE RIGHTS to the modem. In other words, they want to lock the rest of the world out of 56kb. I'll lay odds that anybody else that tries to commercialize a ham product is running into the same thing.

I've personally talked with a couple of vendors. I've been unable to budge this proprietary BS at all. If we want high speed turnkey networking, then let's start putting pressure on the vendors to pick up the ham-designed hardware and go with it. We have the modem. Bdale should have the digital hardware soon. Any number of people reading this group can do the RF. All the vendors have to do is package it and sell it, for christssake. Next time you have occasion to talk to a packet vendor, hit him up as to why they don't get rid of the Not-Invented-Here syndrom and get on the ball.

John

>brian@ucsd.edu (Brian Kantor) replies:
>I suspect we have vastly differing goals in mind here. I want to BUILD
>a high-speed digital network, whilst I think you want to HAVE one.

Hmm. I really can't answer that question. I want to build one and I
also want to have one, which is why I am building one. I am not sure
which one came first.. the chicken or the egg! :-) I THINK I under-
stand what you are saying, but I am really not sure. If your comment
means that I don't want to BUILD something... that is not correct.
I don't mind and in fact enjoy building things. However coordinating
the politics of building a statewide network I do not really enjoy.
If the gear could be bought off the shelf, that goal would become
much easier to implement. That was really the only reason I wrote
what I did.

>If the entire idea were to only USE a high-speed ham radio network, we
>could just go out and buy one.
<Details on how to spend megabucks left out>

I am looking for a happy medium Brian and was just offering what I
felt was a "reality check". There is no need to beat me over the
head with a stick! :-)

<More stuff left out>

>Admittedly, I'm torn between the two opposing goals of having a my cake
>and eating it too: the challenge of building the network and the
>challenge of making good use of it when we have it.

Worry about number 2 after we accomplish number 1.

>Dale Heatherington came up with a brilliant step forward when he
>designed the 56KB modem; other people are making strides to even faster
>links. This is the sort of thing that makes ham radio live for me; I
>suspect I'll be bored with the network after we've built it if we can't
>keep making improvements in it. A package solution just isn't for me.

First, I agree that Dale Heatherington is one great son of a gun! Second, I am already bored with 1200 baud packet. I think we will always be making improvements to packet radio. I doubt you will ever get bored, especially with a mind like yours! You may run low on cash, and you may get a little tired of the politics, but I don't really think you will ever be bored.

>PS: Your prices are probably realistic for new stuff bought over the
>counter; I wouldn't do it that way but if you do that's probably close
>to what you'll pay.

Some I bought new, some I bought used, some I bought broke and repaired.

>A few points, however: most commercial mountaintop
>sites nowadays use multicoupled antennas; you don't need an antenna,
>hard-line, or duplexer because you'll be using the multicoupler.

ALL STOP! DROP ANCHOR! AFTERBURNER IGNITE!

Brian, this is a personal pet peeve of mine so let me apologize in advance, no personal slight intended. BUT !!!

As soon as you ship me a mountain, I'll mount my darn equipment on it! Are you (and other previous posters) aware that there are places in this country that are F L A T like in S M O O T H as in NO MOUNTAINS?!?! Great... I got that off my chest.... sorry. Without a mountain it is very hard to do anything with a radio if you take away the hard-line, duplexers and antennas. We still use multi-couplers and combiners but usually to share a hard-line with a commercial user or to just try and avoid having to put ANOTHER run of it up the tower. BIG BUCKS either way you go.

>Your
>transmitter will need a cavity and a circulator to shoot into the
>multicoupler, especially if it's a ham grade device, since most ham
>gear has a pretty filthy spectrum compared to commercial grade gear,

I am well aware on how to use circulators, isolators, duplexers and the like. I can install, and tune them. Why do you need a circulator to feed into the multi-band coupler unless you are also using a combiner? I have never had to do this, but I sure agree with you on the bandpass cavity!

>The IBM-PC doesn't have to be tower mounted; you can run the digital
>stuff up the tower to the radios - that's a whole lot safer for the
>technicians like me who have to climb the damn thing, since you won't
>be running 115vac mains up there for me to stick my icepick into when
>I'm trying to chip my way through the nine inches of radial ice....

Do what? How do you want me to run the "digital" stuff up a 2000 foot tower? With WIRE? With two MEGAWATT TV stations running on the tower? No, that won't work Brian, you must tower mount it, unless I am missing something here. There is already 220 VAC run up the tower in conduit, along with the elevator cables, etc., etc. When was the last time you

climbed down a 2000 foot tower when the elevator broke? Just curious.

Also... if our towers get that kind of ice on them, forget about the equipment boxes, the antennas or being anywhere near-by unless you want to die. When the ice starts to melt, it "flakes" off the tower in nice big chunks and literally DESTROYS anything in its path on the way down. This includes antennas, dishes, tower cabinets, and bodies if there happen to be any around. It goes right through the roofs of buildings and when it hits the ground it leaves DENTS! (No joke!)

>I wouldn't put an Astron on a mountain; they're insufficiently cooled
>for that sort of duty. Most mountaintop sites around here have massive
>12-volt building supplies anyway, typically batteries floating on a line
>charger and/or photocells, so you don't need to spend that either. The
>one we have one of our remote bases in at 9000ft has 1200amp-hours of
>13.5v on float and we just hook into the busbars. We have a DB-413
>antenna up about 75ft on the main tower for transmit, and we receive off
>the multicoupler, plus we have independent antennas for the two meter
>and six meter remote stations. The controller is a wire-wrapped Z80
>widget and the whole thing has been running in place for almost 10
>years now.

I don't have a mountain, we have generators on the ground, and Astrons work fine if not pushed too hard. My synopsis on equipment needed was built around the requirements in this area (I mentioned that).

I am very impressed with what you have available. I and a lot of others are not so lucky but we are trying to make do with what we have. Of course we have to work at it and it takes a lot more time but we are slowly getting there. Anything that could make our job easier would go a long way towards getting the job done. This was the one and only reason that I wrote my feelings on the matter! :-)

There are quite a few college-level digital communications theory textbooks that can provide a good introduction to the subject. Here's a few on my bookshelf:

Lee and Messerschmitt, "Digital Communication", KAP, ISBN 0-89838-274-2. Excellent, up-to-date publication (copyright 1988). I learned about this one from N4HY, who immediately stole his employer's copy when it showed up in the company library. :-)

Feher, "Digital Communications - Satellite/Earth Station Engineering", Prentice Hall, ISBN 0-13-212068-2. Copyright 1981. As the title suggests it deals primary with satellite communcations, but the sections on modulation and coding techniques are just as applicable to terrestrial links. This one has more of a practical bent than the other books here; it contains some good comparisons of the eye patterns and spectral characteristics of various synchronous modulation techniques.

Bhargava et al, "Digital Communications by Satellite", Wiley, ISBN 0-471-08316-X. Copyright 1981. Another excellent textbook that deals primarily with modulation and coding techniques. More theory and less practice than Feher.

While I'm plugging books, I'd like to mention one that I got recently even though it doesn't deal with digital modulation techniques. It's by Sinnema, and the title is "Electronic Transmission Technology - lines, waves and antennas". It is published by Prentice Hall, ISBN 0-13-252412-0, and copyright 1988. I discovered this one during a plane ride in which I sat next to a college student who was using it as a course text. This is an *excellent* text that neatly fills the gap between the ARRL Handbook (which has lots of "rip and replicate" projects but a very skimpy theoretical foundation) and the E&M course textbooks we used at Cornell (which were so obsessed with mathematics that few could ever see how the stuff could have any practical application).

>Who do I mail to to get on it?

tcp-group@ucsd.edu is the mailing list for all those interested in TCP/IP
over amateur packet radio. More specifically, it is the meeting place
for those working with the KA9Q TCP/IP package. The list has grown quite
a bit of late, largely because the code has become quite popular in
the "regular Internet".

To get on the list, send your request to tcp-group-request@ucsd.edu.
Brian Kantor is the list maintainer.

>Identification for the FCC.. I confess, I haven't thought this all the way
>through.

I assume that you mean you want to build a regenerative repeater, right? If

so, I can see some problems and limitations:

1. It's not as easy as just plugging a demodulator into a modulator. Both the demod and the modulator provide their own clocks. Either you'd have to modify the modulator so that its clock could be slaved to the demod clock (e.g., with a PLL) or you'd have to insert a digital elastic store (FIFO) between the two so that any skew between the two clocks would be matched. The size of the FIFO would have to take into account the maximum transmission size and the worst case skew between the repeater's and the using station's transmit crystal.

2. Assuming you do interface the demod to the modulator, you still have the problem that the regenerative repeater will add a significant delay to the signal in the form of its own carrier-detect time, followed by the time required to switch on its transmitter. Although the presence of a FIFO might avoid requiring your users to increase their TXdelays to compensate, the added carrier sense delay will increase the susceptibility of the system to collisions.

In the absence of hidden terminals, the single most important parameter that affects the performance of a CSMA (Carrier Sense Multiple Access) channel is "alpha". This is the ratio of the combined propagation delay and carrier sense delays to the duration of the packet. Large values of alpha (i.e., near 1) open up large "collision windows" that can render CSMA useless. (This makes intuitive sense -- if the information you get by monitoring carrier on the channel is always out of date, then you don't *really* know if the channel is clear when you begin to transmit.) Large alphas are found mainly on packet satellite channels, but if your carrier detect time is significant (and it is with the WA4DSY modem, about 15 milliseconds or 100 byte times at 56kb) you can have the same problems even on short terrestrial paths.

I think the most promising repeater for the WA4DSY modem is a linear (analog) crossband translator. This would be just like an AMSAT satellite transponder, except that it's attached to the ground. The only signficant source of propagation delay through such a translator would be from the 100 KHz bandpass filter, which would be on the order of 1 / 100KHz = 10 microseconds, i.e., not significant.

Nevertheless, I think it would be excellent if you actually tried the regenerative repeater techique, if only in the hope that my (theoretical) concerns about it prove not to be serious in practice.

Okay, then an extra $500 for a WA4DSY modem isn't that much of a percentage
increase in the total system cost, is it? :-)

Yeah, so this is perhaps a little flip. But I think there's a grain of truth
in what I say. Most of the things you mentioned you'd still need for a 1200
baud packet switch at a tower site, so why handicap your investment in
expensive hardline, antennas, power supplies, etc, just to save $100 or so
on the modem?

One item of yours I will mention:

>IBM PC   What happens to the people that have tower mounted their equipment?

I happen to be from the minimalist school when it comes to equipment at
remote sites. There is no, repeat, NO fundamental need to place full-blown
PCs at switch sites to handle packet. In my last posting I described a 56kb
repeater that puts NO digital hardware in the signal path. Not even a WA4DSY
modem, much less a full blown PC. (You may want some digital hardware there
for system control and telemetry, though.) It is true that such a repeater
does not yet exist, so I plan to building one. At the moment we do have an
experimental system at a local tower site that uses an Ampro Little Board
computer to drive a WA4DSY modem. It's very compact and reasonably reliable
so far. But it will get pulled out when the linear repeater is ready.

The packet switches and server computers belong at peoples' houses where
they can be easily maintained. They can route packets between simple, dumb
linear repeaters on the hilltops, towers and tall buildings.

Yeah, so this is perhaps a little flip. But I think there's a grain of truth
in what I say. Most of the things you mentioned you'd still need for a 9600
baud packet switch at a tower site, so why handicap your investment in
expensive hardline, antennas, power supplies, etc, just to save $100 or so
on the modem? If you're concerned about cost, worry about the cost for
the end user station. There are many more end users than there are
repeaters. But even here I think the difference, given the performance,
is not significant.

One item of yours I will mention:

>IBM PC   What happens to the people that have tower mounted their equipment?

I happen to be from the minimalist school when it comes to equipment at
remote sites. There is no, repeat, NO fundamental need to place full-blown
PCs at switch sites to handle packet. In my last posting I described a 56kb

>   MTTC on a 4 port system is measured in seconds.

WB0MPQ and I have been running NOS (as it has evolved) on 220.55 MHz with WA4DSY modems for about the last year, 24 hours/day. The digital side of things has been amazingly solid. I don't think my PC/XT router (the one with the DRSI card that talks to the modem) has crashed once in the past month. (The standby power supply helps a lot.) The modem link is a little less reliable, as I live next door to a repeater on 223.74 that occasionally desenses the front end in my transverter. We're looking at helical resonators that should fix this problem.

Oh yeah, we typically get a little over 3000 BYTES per second in binary file transfers, disk to disk. Yes, there's room for improvement, but it's a far cry from 200 bytes/sec. I suspect your problem is that you're still trying to use external TNCs, while we're using DRSI cards. The NOS code has an acknowledged problem with talking to the asynch ports at high speed; I've come up with a few promising solutions to that problem, but there's no reason to saddle youself with TNCs when there's already a solution at hand, and a better one (K3MC boards) on the way.

>4. Documentation for NET/NOS. Simply put, even sophisticated users

>   that what separates engineering from hacking is the paperwork.
>   This package, no matter how much work phil and others have put into
>   it, is a hack.

As a sign I once saw at Bell Labs said, "The problem with being on the
leading edge is staying ahead of the blade." Yes, getting TCP/IP up and
running takes more work than regular packet (except, perhaps, for the PK-232
:-)). But powerful systems tend to be more complex than less powerful ones.

Yes, the documentation is sorely lacking. Yes, the package probably does
qualify as a "hack". After all, it's free. I do it in my spare time for fun,
as a labor of love. If you want something more polished, you're welcome to
go to FTP Software and pay upwards of $500 per copy for their PC TCP/IP code
(object only - source is plenty extra) and a very nice manual. And even
then I think you'll discover that there are a lot of things my code can do
that FTP's can't. I believe in building solid foundations before I
put on the window dressings.

A lot of people are productively using my code right now, even in its
present state. Some have offered money, even with no guarantees of support
from me. Things will get better with time, but it'll happen faster if people
help.

Strictly speaking, you mean "the KA9Q Internet Package", not tcp/ip.
There are lots of TCP/IP implementations; mine is only one.

WD4OQC:
>We'd LOVE to see the DSY modem as a commercial product. The problem is
>that EVERY DAMN VENDOR that has approached us that I'm aware of (and I
>do spend a lot of time on the sidelines these days) had demanded

>EXCLUSIVE RIGHTS to the modem. In other words, they want to lock the
>rest of the world out of 56kb. I'll lay odds that anybody else that
>tries to commercialize a ham product is running into the same thing.

Thanks, John, I wasn't aware of that little tidbit. I agree, it is much
better to wait for someone who is willing to accept nonexclusive rights.
This has been TAPR's policy for its projects since the beginning, and I
support it 100%.

As an example of what can happen when a group grants exclusive rights to
their design, consider Sandpac's PS-186. Mike Lamb of AEA has been crying
poverty and crusading for exclusivity for some time, but except for that one
case he's not being very persuasive.

I wish the vendors understood just how valuable the engineering time is that
goes into these projects, and how the volunteer designers are motivated by
wanting to get the technology into the hands of as many hams as possible.
In general they don't mind vendors making a profit on production (after all,
it IS a boring activity) AS LONG AS there's competition to keep them all
honest.

I could tell you about another exclusive-technology-rights deal that
resulted in problems, but this one hasn't played itself out yet. All I can
say is that as long as I'm a director of amateur radio organizations like
TAPR and AMSAT, I'll *never* approve another deal that grants exclusive
rights to volunteer-developed technology to a commercial entity. It'll be
non-exclusive or nothing.

>>various systems are.
>
> Lee and Messerschmitt, "Digital Communication", KAP, ISBN 0-89838-274-2.
> Excellent, up-to-date publication (copyright 1988). I learned about this one
> from N4HY, who immediately stole his employer's copy when it showed up in
> the company library. :-)
>

I resemble that remark!

I also recommend Theory and Practice of Modem Design by Bingham. I forgot
about this one in my blast a few days ago even though I use it regularly.

It talks mostly about 1200 bps 2400 bps telephone modems but is a useful guide. I also recommend for those interested in more rigor, Digital Communications by John Proakis. I will try and think of others and make a good list and post it in some reasonable fashion rather than this hodge podge manner.

Bob

(P.S. The librarian came and brought me the book. She had forgotten to put company marks on it, enter it into the library records, and thus I assumed that I had a long term borrowing allowance on this one ;-) I use Lee and Messerschmidt everyday for at least a reference if not for an actual discussion. It has its faults but to my mind is the best book currently available on these topics. If someone knows of or thinks one is better, please let me know!!)

If you are a user of the KA9Q Networking package, there is a mailing list you may join to communicate with kindred souls.

The primary orientation of the discussions is toward use of the package on Amateur (ham) Radio, but some of the discussions may apply to other uses.

To subscribe to the mailing list, send a message to 'listserv@ucsd.edu' (or whatever variation of that address is appropriate for you), with the

text
     subscribe ka9q-users
in the body of the message. You will receive confirmation of your
subscription by mail, if our admittedly-stupid parser could figure out
your message and return address.

Note that an earlier message in these groups mentioned the 'tcp group'
mailing list; that is a technical workgroup mailing list and probably
isn't what you were looking for.

The TNC approach is the only way to go with non-PC machines,
but the DRSI card is a good alternative for PC users.

>The WA4DSY pre-documentation was talking about an EPROM called KISS-56
>for the TNC-2. Please give me some information about this! I presume,
>that it makes the TNC logic to be "a little bit" more impatient as
>when to send its stuff on the air, thus effectively shortening the

>packets and the delay in interactive use. Am I correct, and if so, how
>much does it speed things up? Anyone tried this?

Ths KISS-56 EPROM is necessary because the regular KISS EPROM is
too slow to handle 56k data. The 56k version IS faster in the way it
handles buffers. A disk with the code is included in the kit.

>Also, the ad stated a few TNC's to be fully TNC-2 compatible, and to
>accept the KISS-56 firmware. The PK-88 was not mentioned, do you know
>if it is compatible? Most of people over here in Finland have a TAPR

>much less attractive.

A true clone of the TNC2 (namely the MFJ1270) or a TNC with the
standard TAPR modem disconnect header such as the PACCOM Tiny 2 is
needed if you choose the TNC option to drive the modem. We can't guarantee
that you can make the necessary mods to any other TNC, or that the
KISS 56 code will work on a non-TAPR clone.

I apologize; your environment is quite different from mine. I spent
several years as a two-way radio tech, including mountaintop service
(and crawling under the seats of suck-trucks) doing commercial FM
stuff. Around here, all we have is mountains: 6000ft to 9000ft is
typical. You stick a 70-ft H-frame tower on a Sears outhouse and go
from there. The rare UHF TV station usually has its own building and
tower next to you, and they sure as hell don't run off solar power.
But then they want $100/rack/month plus $50/antenna/month, so they're
out of the ham price range anyway.

(In fact, in Lost Angeles a few years ago, one villain built a low-power repeater that ran entirely off the rectified TV signal; he stuck it in a small box and bolted it up on the tower where it sat for nearly two months before anyone noticed it. Always had a bit of sync buzz in the audio though....)

But really, I'm advocating that people should try some 56kb ground-based stuff before they start building big networks. And that's what's cheap. Until the PS-186 (or the totally awesome pc i/o card) are available, we don't have good 56kb routers - and even then, we don't have protocols and software to do good routing, so there's a bit of work to be done.

I don't want to hold back anyone from building anything - quite the contrary. I do want to encourage people to EXPERIMENT. We don't have to have a statewide network in place for people to buy or build advanced stuff than will make good use of the network when it IS in place! (Admittedly, you won't get Joe Average Ham as interested until he can use the network, but I just can't see working my butt off to hand a glorious digital network on a silver platter to people who weren't interested before it was perfected.)

And that's sorta where I'm coming from.

It's a good thing that there's an ambulance parked in my driveway tonight. As soon as I finish writing this, I'm going to go outside and hook myself up to the cardioscope: my heart is doing strange things...

I agree 100% with John De Armond.

The techies have done great things with TCP/IP. It's so great and wonderful that the rest of us who aren't TCP/IP gurus, able to decode

I-frames from memory, are lost. The techies want to do it right, while
the rest of us want to do something with it now.

The techies are leaving the rest of us behind.

I don't mean to deride Phil's herculean efforts: far from it. The KA9Q
package is a monumental effort, and one that I couldn't duplicate in
years. Despite all that, it's not a production program: it's a hack. A
neat hack, to be sure, but a hack.

We don't need hacks. We need production systems.

I would like to invite you to join the effort to convert my code from a hack
to a production system. I have stated many times that my own personal
interest lies in creating solid foundations on which others can build useful
applications and user interfaces. This is why I make complete source code
readily available and why I've spent the last year rewriting the application
programming environment.

However, I would like to remind you of one of Rinaldo's Rules, the Codin'
Rule: "He who codes, rules". This rule is particularly applicable to
volunteer software projects.

Phil

>We don't need hacks. We need production systems.

No offense taken, but if that's what you want, you have few choices:

   1) build it yourself
   2) pay someone else to do it for you
   3) dupe someone into doing it
   4) steal it

Far be it from ME to dissuade you from any of the above.

Well, I finally got around to trying to port the latest NOS src (from
wb3ffv's BBS) to Xenix. The files from there have no unix support, no
documentation etc, so I'm poking around in the dark, and using so *OLD*
unix support files that someone had lying around.

Has anyone successfully (or partially) done a port to SCO? I'd hate to
be wasting my time :-) Will there ever be official support for Unix?

Also, is there any documentation, hints for porting etc. Some sample
config files would help.

So far I have managed to get the code to compile and start running. There
were major problems getting to this stage, especially getting mainproc
to work with the adjusted stack pointer referencing pages in memory
that don't (yet) exist etc... I can trace packets on air, but as soon is
I try to start up a telnet (for example) the system crashes. newproc()
must work to some degree, because the four or five initial daemons are
there and running (timer etc..)

Anyone know of a fix, or what I'm doing wrong? It's bound to be either
something stupid that I've overlooked, or something fundamental I don't
understand...

I just love the use of pause() and alarm() internal functions, they go well
when porting to unix :-)

Thanks in advance for any help ...

I have a problem with forwarding SMTP mail. I have a machine that
receives mail from the internet and trys to pass it on to a few hams
in the area. The list is generated by the alias file.

The HAMS don't leave their machines turn-on. When HAMSTER(mail machine)
trys to connect, it cannot. TCP STATUS shows SYN SENT. 20 minutes later,
SMTP cycles again, however, the previous SYN SENT is still there. If a HAM
turns on his machine, it may take 2-3 hours before HAMSTER starts to transfer
mail.   Is there a parameter that will cause SMTP, or everything to give up
completely after a period of time? It would be nice if it would completely
retry after 20 minutes.

PS: We all love NOS.   waiting for manual.......--

Subject: HF BBSs considered obnoxious
Message-ID: <10168@ucsd.Edu>
Date: 23 Nov 89 18:24:19 GMT
Organization: The Avant-Garde of the Now, Ltd.
Lines: 47
Posted: Thu Nov 23 19:24:19 1989

The recent proliferation of HF packet BBSs on popular kbd-to-kbd
channels has led me to the conclusion that the operators of these
systems are people with little regard for their fellow packeteers.

What with overly-frequent beaconing, MAXF settings of more than 1, and
other examples of channel hogging, these BBSs have pretty much made
packet DX a thing of the past.

One presumes, of course, that these people have gone to the trouble of
obtaining an STA waiver from the FCC; clearly they are operating
unattended - for which that is required.

A recent example: in a marathon forwarding session that seemingly
lasted over two days between KA3PLC and KP4GE, the MAXFrame setting on
KA3PLC is clearly set too high - i.e., it's more than 1. This is
evident in that monitoring the transmissions of these two stations
(both quite strong here in San Diego), nearly half of the packets
transmitted by KA3PLC consisted of RETRANSMISSIONS of blocks of frames
where KP4GE had rejected one of the earlier frames in the block. This
is incredibly obnoxious and completely avoidable by setting MAXF to 1.

I presume that KA3PLC also has set DWAIT (the delay before transmitting
if you aren't digipeating) to zero, as there is no perceptible delay
between the RR/RJ from KP4GE and the beginning of his next blast of
redundant packets.

I believe that if HF packet BBS forwarding is to take place, it should be done off the normal calling and working channels.

Beacons are also a source of annoyance and jamming. A BBS which beacons any more often than perhaps once every 15 minutes is just jamming; this is especially true if the beacons are several packets and several seconds in length. KB5BOB (which uses the AX.25 "callsign" of BOBBOX) and some system identifying itself as "MUSTNG" are always apparent on 28.105; they beacon quite often. One presumes that these stations have also obtained STA waivers permitting unattended HF operation as well.

It is my belief that in consideration of the very low baud rates in use on HF packet, and the transitory propagation conditions, it would be A Good Thing if the HF community would agree to move BBSs off of the primary calling and working channels. On 10 meters, with which I am most familiar, I'd suggest putting the BBSs at 28.110. People who want to access them will have a known channel to use, and the other types of packet operation will be unjammed by the heavy BBS traffic. As BBS traffic expands, perhaps 28.115 and 28.120 could also be used.

PACKET RADIO SUPPORTS BAY EARTHQUAKE RELIEF EFFORT

An earthquake measuring 6.9 on the Richter scale and several after-shocks during the following days caused widespread damage in the San Francisco Bay area. ARRL Pacific Division Section Managers Bob Vallio, W6RGG, Richard Wilson, K6LRN, Glenn Thomas, WB6W, and other ARRL officials in the affected areas reported that local emergency nets on the 2-meter and 220-MHz bands are in full swing. The nets provided on-site emergency communications via amateur repeaters to public officials and representatives of The American Red Cross. The extensive packet-radio network on 2 meters and 220 MHz in the San Francisco area was dedicated to handling the heavy volume of health and welfare traffic.

from The ARRL Letter

NORTHERN CALIFORNIA 433-MHZ PACKET-RADIO BAND PLAN PROPOSED

At the last general meeting of the Northern Amateur Relay Council of California (NARCC), a plan was proposed to allocate 433.00 to 433.50 MHz to packet radio. It was tabled because certain questions needed to be answered before approving the new subband. The proposed subband will allow Northern California packeteers to move much of their linking from 2 meters and 220 MHz, which is especially critical if the 220-222 MHz subband is lost, and head in the direction of higher speed links, which are prohibited by emission and bandwidth restrictions on the lower frequencies. (Those frequencies will be used for mail forwarding, keyboard-to-keyboard conversations, DX-spotting network, TCP/IP, etc.) At the October meeting, NARCC hopes to gain final membership approval of this much needed new band of frequencies.

by Brad Watson, WA6AEO, Northern California Packet Association
frequency coordinator - from the NARCC newsletter

MICROSAT TESTING CONTINUES FOR JANUARY LAUNCH

Bob McGwier, N4HY, and Doug Loughmiller, KO5I, spent an entire week performing software and hardware testing of the four AMSAT MicroSats (PACSAT, LUSAT, DOVE, and WEBERSAT), which are now scheduled for launch in January. Chris Williams, WA3PSD, of Weber State College, assisted in the testing. The main thrust of the effort was to perform extensive software testing of the AX.25 protocol and the calibration of telemetry parameters. This software gathers the telemetry values and packetizes them so that they can be transmitted. The spacecraft will send telemetry either as unconnected packets or specific parameters, on request, to a connected station.

One of the most enjoyable aspects of the week's effort was the testing of the WEBERSAT CCD camera. WEBERSAT was set up on a table in the MicroSat laboratory with its camera pointed to the mountains around Boulder, Colorado. A command to take a picture was sent to WEBERSAT from across the room using VHF/UHF radios. The picture was taken, the information was stored and processed, and then it was sent from the WEBERSAT MicroSat back across the

room to a laptop computer via a TAPR PSK demodulator, an MFJ TNC-2 clone, and ICOM 275/475 transceivers.

The Weber State College-developed software reprocessed the picture data and produced an excellent digitized image on an EGA screen. At this point, there was much joy and celebration expressed by the entire MicroSat test team. Chris Williams said that because of the launch delay, the software to process the pictures will be available from AMSAT-NA shortly before launch.

At this point there will be only minimal testing of the MicroSats until the launch campaign begins. Until then, only a skeleton crew will maintain satellites.

from AMSAT News Service

NOVICE NOTCH: NORTHERN OHIO

In Northern Ohio, there is quite a selection of activities for the Novice packeteer to choose from including several PBBSs on 223.70 MHz:

KA8Z in Canton
N8FIS is Fremont
W8HHF in Toledo
WA8BXN in Cleveland
WB8JUI in Bellevue

There are also a number of network nodes that are accessible on 223.70 MHz. These ports allow Novices to access over 60 nodes via the 4800-baud, 70-cm trunk network that operates throughout Ohio. The systems with 223.70-MHz ports include:

K8EIW-5 (CAN2) in Canton
K8EIW-9 (CLE220) in Cleveland
KA8TEF-3 (REP2) in Republic

For the Novice who is ready for more of a challenge, there are several TCP/IP systems that allow cluster routing throughout the state via the developing TCP/IP network. TCP/IP systems that are accessible on 223.70 MHz include:

KA8Z in Canton
WA8BXN in Cleveland
WB8JUI in Bellevue
WB8LYF-4 (#RSNIP) in Risingsun

from Phil Frazier, KA8TEF @ N8FIS [44.70.16.1]

(Gateway would like to continue publicizing Novice packet-radio activity, so if you know of any, please let me know, too. - WA1LOU)

RUDAK REVIVAL PARTIALLY SUCCESSFUL

Last week, Peter Guelzow, DB2OS, and others made another attempt to revive RUDAK (a German acronym for "Regenerating Transponder for Digital Amateur Communication") to see if was possible to bring it on-line after sitting idly for approximately six months. RUDAK was intended to be a packet-radio digipeater aboard OSCAR 13, but shortly after the launch, it was discovered that the RUDAK bootstrap loader would not load the necessary software. The culprit appeared to be a defective PROM chip that holds the bootstrap loader software.

However, last week some success was achieved when the bootstrap loader started loading software from the ground station. Although it was still not possible to load all of the necessary software, the mere fact that the RUDAK bootstrap loader worked at all leaves room for hope. The results of this attempt will be analyzed by DB2OS, Hanspeter Kuhlen, DK1YQ, and others and future efforts will be planned. Perhaps with a little bit of luck, RUDAK can eventually be brought into operation.

from AMSAT News Service

NEW SOFTWARE RELEASES

AA4RE's BB, Version 2.7, a PBBS for IBM PC and compatible computers is available for downloading from CompuServe's HamNet data library 9 (DL9), COYnet Landline BBS (914-485-3393), Pleasant Valley Phone BBS (508-688-1348), and WA6RDH's telephone BBS (916-678-1535), or it is available on disk from TAPR (PO Box 12925, Tucson, AZ 85732).

G3ZCZ's LAN-LINK, Version 1.54, a terminal program for IBM PC and compatible computers with multi-mode controllers/TNCs is available for downloading from CompuServe's HamNet data library 9 (DL9).

G8BPQ's TheNode, Version 3.51, networking software for IBM PC and compatible computers is available for downloading from CompuServe's HamNet data library 9 (DL9), and Pleasant Valley Phone BBS (508-688-1348).

R95, Version 1.2, a binary to data text conversion utility for IBM PC and compatible computers is available from Texas Packet Software (PO Box 50106, Denton, TX 76206).

W0RLI Mailbox, Version 11.4, a PBBS for IBM PC and compatible computers is available for downloading from CompuServe's HamNet data library 9 (DL9), N1EDF's telephone BBS (508-949-3590), Pleasant Valley Phone BBS (508-688-1348), VE3GYQ's telephone BBS (519-660-1442) or it is available on disk from TAPR (PO Box 12925, Tucson, AZ 85732). (File name FS1104.EXE is the fast upgrade for those who already have Version 11.2, while file name MB1104.EXE is the full-blown version.)

MORE CONFERENCING NEWS

(The previous issue of Gateway included a number of reports from the ARRL 8th Computer Networking Conference that were written by Jon Bloom, KE3Z. Two additional reports from the conference follow. The first was provided to Gateway by Greg Jones, WD5IVD. The second report was written by J. G. Beattie, Jr. N2DSY and was downloaded from CompuServe's HamNet.)

N2DSY's Conference Report

The Radio Amateur Telecommunications Society (RATS) was well represented at the conference by J. Gordon Beattie, Jr, N2DSY and Tom Moulton, W2VY. Many copies of the ROSE X.25 packet switch software were distributed (for free) along with manuals. A network of ROSE X.25 Switches and a bulletin board was established without prior notice by folks from all over the world! Approximately 60 folks came through our hospitality room on Saturday evening to collect software for the switch and the first release of the RATS Broadcast Server/Client programme "BBC." Another score came through on Sunday. Everyone had a chance to exchange ideas and experiences while enjoying the antics and humor.

The presentations on the ROSE X.25 Switch and OSI at the formal part of the conference were from people all over the world. This is an extremely important turn of events. Folks now come to this conference to present their OSI protocol experiences without prior contact with RATS or our software. Among other surprises, we discovered that Steve Pink, KF1Y, and Anders Klements, SM0/RGV, have been working with the ISODE OSI software, Further. They also have been working with another person on their staff who has written another implementation of X.25! All in all it was a splendid conference with a lot of progress for the ROSE X.25 Switch, OSI and other important technologies needed by the amateur community.

WD5IVD's Conference Report

The 8th ARRL Computer Networking Conference took place on the weekend of October 7 in Colorado Springs, Colorado, at the US Air Force Academy. The conference was sponsored by TAPR, Academy Amateur Radio Club, USAFA Cadet Radio Club, Rocky Mountain Packet Radio Association (RMPRA), and the ARRL. The event was organized by TAPR president Andy Freeborn, N0/CCZ. Most people thought the conference was the best one yet. In attendance were approximately 150 amateurs from across the country and the world including such QTHs as Canada, the Netherlands, Costa Rico, Italy, England, Australia, Sweden, and Mexico. This year's proceedings encompassed HF packet radio, networking, applications and users, high-speed packet radio, satellites, and other general packet-radio papers.

A group of conference attendees visited the Air Force Academy for a tour on Friday. The hospitality suite was well attended all day Friday at the Marriott and saw numerous packet-radio (and other discussions) break out. The actual conference was on Saturday with talks starting promptly at 9:15 AM, after an introduction by N0/CCZ. Paul Newland, AD7I, took on a new role, that of high-tech sergeant-at-arms. With the use of "modern technology," Paul was able to let everyone know, in more than one way, before the trap door opened for the speakers. The system worked very well

and let everyone presenting have their fair share of time.

Conference Presentations

A discussion of the ARRL HF design project was presented by Paul Rinaldo, W4RI.

"HF Diversity" by Steve Hall, WM6P, described using multiple receivers to improve reception of HF packets.

"AMTEX, NAVTEX-like Dissemination Procedures for Amateur Radio" by Paul Newland, AD7I, described how AMTOR could be used to provide better dissemination of bulletins in the amateur community by using a simple coding scheme.

An update on ROSE X.25 Switch activity and a description of how it works by Thomas Moulton, W1VY.

"A Packet Broadcast Protocol" by Gordon Beattie, N2DSY, presented a broadcast protocol for use in packet radio.

"Routing, Oh Where is My International Routing" by Chuck Hast, TI3DJT, presented a description of the current packet-radio network in Central America and some of the problems encountered to date in its construction.

"Amateur TCP/IP in 1989" by Phil Karn, KA9Q, discussed the current status of the KA9Q Internet Protocol Package and other related projects.

(Continued next Part)

WD5IVD's Conference Report - Continued

"Callsign Server for the KA9Q Internet Protocol Package on the Apple Macintosh" by Doug Tom, N6OYU, and Dewayne Hendricks, WA8DZP, discussed a TCP/IP call sign server, its implementation, and impact.

"Design of a Next-Generation Packet Network" by Bdale Garbee, N3EUA, looked at technologies that have potential for impacting future packet-radio networks. A preliminary proposal was made for an example of this network configuration to be installed in the Rocky Mountain region.

"Application Software for Packet Radio" by Robert Taylor, KA6NAN, and Dewayne Hendricks, WA8DZP, discussed the possibilities of applications for amateur packet radio. A packet-radio chess program for the Apple Macintosh computer was used as an example.

"Protocol Level Eight -or- What About the Users?" by Lyle Johnson, WA7GXD, asked if packet radio will be useful to communicators or will it remain in the domain of the "techies?" Lyle discussed future implementations of packet radio for the normal user.

"Thoughts on Adaptive Link Level Protocol" by Lyle Johnson, WA7GXD, presented some new packet-radio issues.

A study by Roy Goud, N5RG, concerned the possible transmission methods that could be used in high-speed packet-radio networks.

"Implementation of a 1 MBPS Packet Data Link Using 10-GHz RF" by Glenn Elmore, N6GN, and Kevin Rowett, N6RCE, presented the design and implementation of an amateur packet-radio data link operating at 1 Megabit/s.

"The Implications of High-Speed RF Networking" by Mike Chepponis, K3MC, Glenn Elmore, N6GN, Bdale Garbee, N3EUA, Phil Karn, KA9Q, and Kevin Rowett, N6RCE, discussed planning and the future applications for high-speed RF networks.

"ATS-3 Packet Experiments: The Potential Impact of Packet Radio Upon Pacific Basin Communications" by Gerald Knezek, KB5EWV, and Greg Jones, WD5IVD, reported on work being done at the University of North Texas to provide low- cost data communications via packet-radio LAN and WAN communications in the Pacific Basin.

"MicroSat Status Report" by Lyle Johnson, WA7GXD, and Jon Bloom, KE3Z, discussed the current status of the MicroSat project.

"Tucson Amateur Packet Radio packetRADIO Project" by Greg Jones, WD5IVD, and Pete Eaton, WB9FLW, reviewed the TAPR packetRADIO project.

"A Multi-Channel IBM PC Packet Interface" by Henk Peek, PA0/HZP, discussed a universal medium-speed packet-radio interface for the IBM/PC ISA bus.

"Design and Implementation of an AppleTalk Local Area Network Bridge Using Packet Radio" by R. Ramsey and W. Kinsner, VE4WK, discussed the design and implementation of an LAN bridge based on the link layer AX.25 packet-radio protocol and the AppleTalk Personal Network on the Apple Macintosh computer.

Digital Committee Meeting and RMPRA Packet-Radio Conference

On Sunday, the ARRL Digital Committee met and RMPRA held a packet-radio conference (for more on the committee meeting, see the previous issue of Gateway). At the RMPRA conference, Kantronics showed its new 2-meter, 9600- baud packet radio and demonstrated an alpha-test version of a dual-port data- over-radio platform. DRSI showed layouts of their implementation of the K3MC "Awesome I/O Card." PacComm was also present displaying its packet-radio product line. Texas Packet Radio Society (TPRS) answered question about TexNet and showed TexNet hardware. TAPR sold its products and Radio Amateur Telecommunications Society (RATS) members were available throughout the conference with their new software release.

GATEWAY CONTRIBUTIONS

Submissions for publication in Gateway are welcome. You may submit material via the US mail to:

     Gateway
     Stan Horzepa, WA1LOU
     75 Kreger Drive
     Wolcott, CT 06716-2702

or electronically, via CompuServe to user ID 70645,247 or via Internet to 70645.247@compuserve.com. Via telephone, your editor can be reached on evenings and weekends at 203-879-1348 and he can switch a modem on line to receive text at 300, 1200 or 2400 bit/s. (Personal messages may be sent to your Gateway editor via packet radio to: WA1LOU @ W1AW.)

The deadline for each issue of Gateway is the Saturday preceding the issue date (which is typically a Friday).

REPRODUCTION OF GATEWAY MATERIAL

Material may be excerpted from Gateway without prior permission, provided that the original contributor is credited and Gateway is identified as the source.

ARRL LETTER - November 3, 1989 - Volume 8 Number 22 - Part 1 of 3

ARRL EXECUTIVE COMMITTEE MEETS

The Executive Committee of the American Radio Relay League met on October 21 in St. Louis. Among EC actions were:

- Accept the Election Committee report on the Director and Vice Director elections for the 1990-1991 term as presented by its Chairman.
- Review and authorize the filing of a cleanup petition seeking those revisions to Part 97 that had been sought by the League, but not incorporated by the FCC in its recent proceeding to reorganize Part 97.
- Instruction to ARRL Counsel Imlay, N3AKD, to file a request with FCC for a declaratory ruling preempting state statutes and local ordinances that restrict the possession or operation by licensed amateurs of Amateur Radio equipment having the incidental capability to receive frequencies outside the amateur bands.
- Voted to amend the 902 MHz band plan so that 906.0-909.0 MHz is designated for repeater outputs and 918.0-921.0 MHz is designated for repeater inputs, this being the reverse of what was adopted by the Board in July at Minute 57 but the sense of what had been agreed to at the Torrance, California, meeting.
- Bestowed upon John Grebenkemper, KI6WX, the 1988 Technical Excellence Award for his two-part QST article, "Phase Noise and its Effects on Amateur Communications."

The Executive Committee also reviewed the status of a number of ongoing FCC, international and organizational matters. The full text of the Minutes will appear in December QST.

LAIRD CAMPBELL, W1CUT, RETIRES

November 1 marks the end of an era at ARRL Headquarters: Laird Campbell, W1CUT, is retiring from the staff after more than 35 years of service to Amateur Radio.

In his letter to the Directors, ARRL Executive Vice President Dave Sumner, K1ZZ said, "No one person has contributed to the League in more different ways than Laird." He joined the staff in 1954 as a contest assistant in the Communications Department, but soon moved to the Technical Department where he spent nine years as a Technical Assistant. A move to the Production Department as Assistant Managing Editor came in 1964, followed by a promotion to Managing Editor a year later. In 1972, Laird became Advertising Manager and served in that position until being named Assistant General Manager for Business Operations by Dick Baldwin in 1976. For the eleven weeks of WARC-79, Laird was Acting General Manager and kept things running on the home front while Dick and Dave were in Geneva. More recently, Laird returned to helm of his first love -- the Production Department -- while also serving as Senior Staff Assistant for personnel matters.

Dave concluded his statement saying, "The Museum of Amateur Radio has been a special interest of Laird's and we owe a great deal of what we know today

about the artifacts located at ARRL HQ due to his careful stewardship.

"I know I speak for the entire Board family in wishing Laird well. Mark Wilson, AA2Z, will be taking over as Production Department Manager/Managing Editor; but no one will take Laird's place in our hearts."

LOWER-LAYER IMPROVEMENTS DOMINATE 8TH COMPUTER NETWORKING CONFERENCE

The ARRL Amateur Radio 8th Computer Networking Conference was held in Colorado Springs, Colorado, on Saturday, October 7, with approximately 150 attendees. In conjunction with the conference, the Rocky Mountain Packet Radio Association (RMPRA) held a packetfest on Sunday. The ARRL Digital Committee met that same day. New or modified level 1 and 2 packet-radio protocols were discussed in several papers, as were improvements to the radio systems in use.

A proposed broadcast protocol was presented by Gordon Beattie, N2DSY. This protocol is implemented in the BBC software package, which is part of the Radio Amateur Telecommunications Society (RATS) ROSE system. Improved performance of the AX.25 link-layer protocol was proposed in papers by Lyle Johnson, WA7GXD, Eric Gustafson, N7CL, and Detlef Schmidt, DK4EG.

On the radio front, the fast-approaching advent of high- speed packet-radio hardware (see related story entitled "Awesome I/O Card in Beta Test") brought forth much discussion of the need for coordinated network efforts, culminating in a continental high-speed network. To whet the appetites of the packeteers present, Bdale Garbee, N3EUA, displayed the 10-GHz, 1-Mbit/s packet-radio system developed with Glenn Elmore, N6GN.

ARRL LETTER - November 3, 1989 - Volume 8 Number 22 - Part 2 of 3

PACKET OPERATIONS DURING THE SAN FRANCISCO EARTHQUAKE: LESSONS LEARNED, SUGGESTED IMPROVEMENTS

Lew Jenkin, N6VV, is a member of the Northern California Packet Association which is comprised of an extensive packet network made up of hilltop node locations and over 30 BBS systems spread from Redding in the far northern part of California to Kern County in the central part of the state.

As one of the packet bulletin board system operators (Sysop) for the network, Lew was involved in handling heavy amounts of health and welfare traffic generated immediately after the October earthquake in the San Francisco Bay area.

After the dust had settled a bit, Lew wrote down his thoughts about the performance of the packet network and lessons learned from the emergency created by the earthquake. Here is a summary of his observations and recommendations:

- Have a network backup plan, in place in anticipation of emergency situations.
- Packet is well designed to handle high volumes of Health and Welfare

traffic during emergencies. Tactical communications, however, are better handled by voice.
- Because of networking possibilities, packet networks can respond better than any other form of amateur communications to changes in the emergency situations. Members of Northern California Packet Association were able to completely reroute traffic throughout the entire system in less than 3 hours.
- There is a need for an emergency bulletin designator, supported, but used only in extreme emergencies.
- Every amateur using packet bulletin boards should be familiar with packet NTS procedures. Circumstances generated by the earthquake required as many hams as possible with packet capability to become involved with handling traffic.
- All NTS traffic should be ZIP code routed. A major problem was misaddressed or non-addressed traffic requiring manual intervention.

Lew feels that the San Francisco earthquake was "the first great test for this new packet technology" and in general, passed the test with flying colors under what at times seemed like an impossible situation.

As of October 21, approximately 3000 health and welfare messages were posted on the N6VV bulletin board. 2200 of them had been delivered. All of the messages were, at one point, carried through the network on 220.90 MHz.

W1AW TELEPRINTER TRANSMISSIONS

Recently, in response to suggestions that the AMTOR transmission be sent first on teleprinter bulletin transmissions. W1AW conducted an informal poll of listeners. The results were dead even, indicating no mandate in either direction. Since a large number of those who copy AMTOR stated that they do so by automatic means and that it makes no difference to them which transmission is first, it seems to us that W1AW can best serve teleprinter listeners by retaining the Baudot-ASCII-AMTOR order of transmission. Further inputs are welcome.

ATTENTION CONTESTERS

Many amateurs have been confused by Part 97.119(a) of the new Part 97 concerning station identification. This rule states, in part, "...No station may transmit unidentified communications or signals, or transmit as the station call sign, any call sign not authorized to the station." ARRL asked FCC for a clarification of this. The Personal Radio Branch (which governs Amateur Radio) of the FCC has stated the following:

"When another Amateur comes over to your house to operate your station, there are two possible station identification situations:

"First, you may designate him as the control operator of your station. Accordingly, he must identify with your station's call sign when operating within the privileges of both his license and yours. (He signs his call following your call when he operates with privileges that exceed yours). You both share responsibility for the station operation as outlined above.

"Second, you may simply "loan" your equipment to your friend. The equipment in your shack then becomes his temporary station location. He is the station licensee and control operator. Remember, a station location is any place you can have radio equipment--a basement, car or specific geographic location. In this case, he identifies with his own station call sign, and is solely responsible for the operation of the station.

"Often, hams will travel to another, more effective station to snag a rare DX country through a pileup or work a contest, and want to use their own call sign for DX or contest credit. This is fine under situation two described above."

ARRL LETTER - November 3, 1989 - Volume 8 Number 22 - Part 3 of 3

UA-K GLASNOST

The Portland Amateur Radio Club (PARC) delegation of 7, departed Portland on September 20. Making the trip to Khabarovsk, USSR were Dick Fredrickson, WA0DIM, Kevin Hunt, WA7VTD, John White, K7RUN, Rene Berblinger, KX7Z, and David Wright, N7MYO. Hosting their stay were members of the Khabarovsk Amateur Radio Club. Amateur licenses were given to the visitors by the government.

This was the first ever Radiosport competition in which US Hams competed on Soviet soil. Another first was that the Soviet government granted permission to operate portable and mobile during the visit. Portable operation is not normally granted to Soviet amateurs.

In another example of glasnost, two Soviet amateurs were examined on September 28 at the first ARRL/VEC coordinated session in the USSR. The session was held in Khabarovsk in eastern USSR and sponsored by the Portland Oregon ARC VE Team.

The two amateurs were Gene G. Shulgin, UZ3AU (who passed the 20 WPM Morse code exam and the Element 2 written exam--qualifying for the Novice License) and, Mike A. Zavarukhin, UA0CN who passed the 20 WPM Morse code exam and all written elements to qualify for the Amateur Extra class license. Both Gene and Mike should be using their new licenses during a visit to the U.S. sometime in 1990 or 1991.

FCC DENIES PETITION TO CHANGE NAME OF AMATEUR EXTRA CLASS OF LICENSE

On October 20, the FCC denied the petition of Keith Greiner, AK0Q, that proposed changing the name of the Amateur Extra Class operator license to "Master of Radio Communications." FCC said that, "Implementation of the petitioner's request would..require significant efforts not only by the Commission but also by the volunteer examiners and volunteer examiner coordinators," referring to the number of licensing forms currently in use that would require modification.

Also sited by FCC was the fact that only 15 members of the public commented in the proceeding out of almost half a million licensees making the perceived advantage of the name change minimal at best. In closing, FCC

stated, "In view of the clear cost of undertaking this rule change and the questionable benefits involved, we conclude that a proposal changing the name of the Amateur Extra Class operator is not in the public interest and does not warrant consideration by the Commission at this time."

AO-13 IHU CRASHES AGAIN; OPERATIONS CEASE

On Saturday, October 29 at approximately 2328 UTC, AMSAT Ground Command Station VK5AGR noted there was no Mode B transponder operation or telemetry on OSCAR-13's general beacon on 145.812 MHz. At this point VK5AGR sent a few commands to OSCAR-13 and waited to see if it's IHU would switch to Mode JL. It didn't.

AMSAT Ground Command Station G3RUH sent the "reset" command at 1138 UTC on Sunday, October 29. DB2OS was able to upload a short routine to the IHU's memory turning off all the transponders and sending the telemetry in an abbreviated format. The OSCAR-13 spacecraft is now in a condition where it is ready to receive its flight software again.

Stay tuned to AMSAT Nets and ARRL Bulletins for further notice on the progress of the return of OSCAR-13 to normal operation.

1990 ARRL HANDBOOK AVAILABLE

Now in its 67th edition, this annual publication has been the radio amateur's primary reference work on the technical aspects of Amateur Radio and radio communications technology since 1926.

Over the years, the ARRL Handbook for the Radio Amateur has evolved into a practical resource for engineers and radio technicians the world over. It has also enjoyed immense popularity as a teaching tool at technical schools and universities. Topics of general interest include basic electronics theory, practical circuits, and construction projects.

The new edition of the 1990 ARRL Handbook features many new projects, including three high-performance VHF/UHF Yagi antennas by Steve Powlishen, K1FO. The chapter on space communications has been completely revised; now included is current information on OSCAR 13 (Orbiting Satellite Carrying Amateur Radio), and a new 4-element helical array for Mode L (1260-1270 MHz uplink). There is also new information on amplitude-compandored single sideband (ACSSB).

The 67th edition of the ARRL Handbook was edited by Kirk Kleinschmidt, NT0Z, and contains over 1200 pages and over 2100 tables, figures and charts.

SOUTHWEST OHIO DIGITAL SYMPOSIUM: CALL FOR PAPERS

A preliminary call for papers for the 4th Annual Southwest Ohio Digital Symposium has been announced. The symposium will be on January 20, 1990 at the Middletown Campus of Miami University in Middletown, Ohio. At present, there is no set agenda nor time frame. Preliminary ideas, generated from feedback from last year's event include:

1. A much-expanded session (probably a concurrent separate session) on how to get started in packet radio,

2. Networking - the next steps,

3. SYSOPs' discussion group,

4. MicroSat and other topics of interest concerning satellites,

5. Alternatives to TNCs for handling node functions: G8BPQ switch, TexNet experience, next generation, etc,

6. Super fast networking,

7. New PBBS software,

8. Duplex LANS, and

9. The TAPR packetRADIO.

The symposium is a cooperative effort hosted by the Engineering Technology Department of Miami University, the Middletown DIAL Twisters (Dial Radio Club), the Ohio Packet Council, and the Cincinnati Buckeye Netters.

Please send ideas to:

Hank Greeb, N8XX @ KC8TW
6580 Dry Ridge Rd
Cincinnati, OH 45252

from Hank Greeb, N8XX via CompuServe's HamNet

JAS-1 OPERATION TERMINATED

The operation of Amateur Radio satellite JAS-1/FUJI-OSCAR 12 was terminated on November 5 because of low power generation. During the three-year operation of the satellite, its power generation has decreased with time and, at present, its average power generation is less than 3 watts.

The Japanese Amateur Radio League reported, "It is our great pleasure to realize that we were able to provide chances of satellite communication, especially the flying BBS, and, taking this opportunity, we thank all satellite enthusiasts for having contacted the bird. Now we are preparing the next bird, JAS-1b, as the successor of FO-12, which has the same mission configuration as that of FO-12 except for its orbit. Please look forward to its launch in February 1990."

ARRL RECEIVES FEMA GRANT FOR HF MODEM DEVELOPMENT

The ARRL recently received a $10,000 grant from the Federal Emergency Management Agency (FEMA) for HF packet-radio modem and protocol development over the next two years. The ARRL will use the grant to fund out-of-pocket costs (excluding labor or overhead) for volunteer participants in the development program. (FEMA has a special interest in effective communications between FEMA representatives and Amateur Radio operators at the onset of natural disasters.)

Existing packet-radio hardware and software operate effectively above 30 MHz. At HF (3 to 30 MHz), however, reception of packets is often poor because of fading and interference. The purpose of the FEMA grant is to encourage development of techniques to improve the reliability of HF packet-radio reception. The ARRL has identified several areas for research to improve reliability and reduce retransmissions: modems, protocols, diversity reception and network management techniques.

Designers or design teams wishing to participate in this program are invited to contact Lori Weinberg at ARRL headquarters. Mail a resume of each person in the team giving qualifications in the above areas of

research and a brief description of the design approach (not to exceed three pages, double-spaced). Formal proposals are not sought at this time, but will be requested in the near future.

UoSAT-D PCE PLANS ANNOUNCED

The UoSAT-D PACSAT Communications Experiment (PCE) will be an open-access Amateur Radio store-and-forward system (UoSAT-D is scheduled for launch in January along with a second UoSAT and four AMSAT MicroSats). Although there will certainly be some gateway stations (since they are efficient and cost-effective), any properly equipped amateur station will be able to use the PCE.

A ground station for the PCE must have a G3RUH-compatible, 9600- bit/sec PSK modem. This modem should be connected to a Mode-J satellite station: 145.975-MHz uplink and 435.070-MHz downlink. This modem and RF equipment must be connected to a TNC. Ground station antenna and RF power requirements should be modest; final satellite receiver sensitivity and antenna pattern measurements are now under way at University of Surrey.

To access the PCE PBBS, you will need special software running on your ground station computer. The PACSAT Ground Station Software will communicate with the PCE over your AX.25 TNC using high- level protocols currently under development by Jeff Ward, G0//K8KA, and Harold Price, NK6K. This system, ie, requiring you to connect your TNC to a host program and not to a terminal emulator, will provide a powerful electronic mail service that eliminates many of the frustrations experienced by users of the existing ground-based PBBS network. (The standard PACSAT protocols will also be implemented on the AMSAT-NA Microsats, although not using 9600-bit/sec PSK modulation.)

Full details of the PACSAT protocols will be published as soon as they are available. (A Broadcast Protocol specification, for transmission of bulletins, etc, has already been published in the proceedings of DATASPACE '89.) When published, the protocol specifications will allow software authors to begin implementing the PACSAT Ground Station Software for different computers. It is also likely that a PACSAT Ground Station Software implementation for IBM-PC compatible computers will be produced by UoSAT and AMSAT-NA and made available to other amateurs.

from Jeff Ward, G0/K8KA @ GB3UP.UK.EU via CompuServe's HamNet

TANDY COLOR COMPUTER PACKET-RADIO TERMINAL EMULATION SOFTWARE AVAILABLE

CoCoPACT/CoPACT3 are two full-featured terminal programs designed for amateur digital communications using the Tandy TRS-80 Color Computer 1, 2 or 3 and a TNC or multimode controller. The software features split-screen operation with received data displayed in the upper screen and local keyboard data displayed in the lower screen. Special handling of TNC control codes, stream/channel switches and other TNC functions are provided

to simplify control of the TNC. The programs include a 40-kbyte QSO buffer and ten user-defineable macro keys. A built-in editor can be used to create and edit incoming and outgoing data off-line.

While CoCoPACT is intended for all Color Computers, CoPACT3 is intended for the Color Computer model 3 only and features 80- column display, an additional 24-kbyte transmit buffer, and a selectable 2400-baud serial-port data rate. The programs are available on disk or tape from Monty W. Haley, WJ5W, Rt 1, Box 210-B, Evening Shade, AR 72532. Contact him for details.

W0RLI MAILBOX VERSION 11.5 AVAILABLE

W0/RLI Mailbox, Version 11.5, a PBBS for IBM PC and compatible computers is available for downloading from CompuServe's HamNet data library 9 (DL9), N1EDF's telephone BBS (508-949-3590), Pleasant Valley Phone BBS (508-688-1348), VE3GYQ's telephone BBS (519-660-1442), or is available on disk from TAPR (PO Box 12925, Tucson, AZ 85732). (File name FS1105.EXE is the fast upgrade for those who already have Version 11.4, while file name MB1105.EXE is the full-blown version.)

NAVAL ACADEMY PACKET-RADIO LINK IN OPERATION

For those who would like to forward packet-radio messages to midshipmen at the Naval Academy in Annapolis, the K1LNJ PBBS in Severn, Maryland, will pass the messages to the midshipmen's computer in their Bancroft HX

==59

To start the service, advise the midshipman to open a "mailbox" with CMS by calling up FISHNET using their existing ProComm software. At the ACU> prompt, enter ALT-P. Select option 5 (9600 and E-7-1) to change the protocol and save the changes. Return to the ACU> prompt and type C FISHNET. Once connected, type C CMS and log on as NEW. In a couple days the midshipman's ID will be validated and thereafter, he or she can post and receive messages.

To send a packet-radio message to the midshipman, address the message as NTS to USNA @ K1LNJ. Be sure to include the midshipman's "Username" on the CMS link (usually the first letter of the first name and the first six letters of the last name). Midshipmen should address their return messages to "BHOWARD" and include the recipient's call sign and @ PBBS. Any questions should be addressed to K1LNJ @ K1LNJ (available from the DCA node stack in the Virginia-Maryland-DC area), or for long haul (HF), via K1LNJ @ N4QQ or K1LNJ @ W3IWI.

PACKET-RADIO OPERATIONS DURING THE SAN FRANCISCO EARTHQUAKE: LESSONS LEARNED, SUGGESTED IMPROVEMENTS

Lew Jenkins, N6VV, is a member of the Northern California Packet Association, which is composed of an extensive packet-radio network made up of hilltop node locations and over 30 PBBSs spread from Redding in northern California to Kern County in the central part of the state.

As one of the PBBS SYSOPs for the network, Lew was involved in handling heavy amounts of health and welfare traffic generated immediately after the October earthquake in the San Francisco Bay area. After the dust had settled a bit, Lew wrote down his thoughts about the performance of the packet-radio network and lessons learned from the emergency created by the earthquake. Here is a summary of his observations and recommendations:

- Have a network backup plan in place in anticipation of emergency situations.

- Packet radio is well designed to handle high volumes of health and welfare traffic during emergencies. Tactical communication, however, is better handled by voice.

- Because of networking possibilities, packet-radio networks can respond better than any other form of amateur communications to changes in the emergency situations. Members of the Northern California Packet Association were able to completely reroute traffic throughout the entire system in less than three hours.

- There is a need for an emergency bulletin designator, supported, but used only in extreme emergencies.

- Every amateur using PBBSs should be familiar with packet-radio NTS procedures. Circumstances generated by the earthquake required as many hams as possible with packet-radio capability to become involved with handling traffic.

- All NTS traffic should be ZIP code routed. A major problem was incorrectly addressed or unaddressed traffic requiring manual intervention.

Lew feels that the San Francisco earthquake was "the first great test for this new packet-radio technology" and, in general, passed the test with flying colors. As of October 21, approximately 3000 health and welfare messages were posted on the N6VV PBBS and 2200 of them had been delivered. At one point, all of the messages were carried through the network on 220.90 MHz.

from The ARRL Letter

HOW TO USE A WHITE PAGES SERVER

The WA1IIE.ME BBS is now a White-Pages Cache-Server. It stores (and forwards) information about stations, their home PBBSs, etc. The following commands are used by the server:

I CALL Query the local database for all information
concerning a call sign. For example: I N1HAM.

I@ BBS List users at home PBBS. Trailing * may be used as a wild
card. For example: I@ W9ZRZ or I@ HB*

IA List all users.

IC List all users that have logged in.

IL List local users of this mailbox.

IZ ZIP List users at a ZIP code. Trailing * may be used as a wild
card. For example: IZ 950*

To get information concerning a call sign, etc, you send a personal message from your home PBBS as follows:

SP REQWP @ WA1IIE.ME.USA

Subject: Leave blank

Message: Your request goes here, for example, to get the "address" of WA1ABC, the stations at ZIP code 0498*, and the stations whose home PBBS is K1RQG, your request would be as follows:

```
I WA1ABC
IZ 0498*
   I@ K1RQG
   <CTRL-Z>
```

As with all servers, the PBBS will create a message containing the requested information and send it to you at the PBBS where your request was initiated. If you have any questions, contact WA1IIE @ WA1IIE.ME.USA.

Subject: TAPR 9600 RAdio/Modem??? (Longer)

brian@ucsd.edu (Brian Kantor) replies:
>I apologize; your environment is quite different from mine.
<good stuff left out>

>But really, I'm advocating that people should try some 56kb ground-based
>stuff before they start building big networks. And that's what's cheap.
>Until the PS-186 (or the totally awesome pc i/o card) are available, we
>don't have good 56kb routers - and even then, we don't have protocols
>and software to do good routing, so there's a bit of work to be done.

>I don't want to hold back anyone from building anything - quite the
>contrary. I do want to encourage people to EXPERIMENT. We don't have
>to have a statewide network in place for people to buy or build advanced
>stuff than will make good use of the network when it IS in place!
>(Admittedly, you won't get Joe Average Ham as interested until he can
>use the network, but I just can't see working my butt off to hand a
>glorious digital network on a silver platter to people who weren't
>interested before it was perfected.)

>And that's sorta where I'm coming from.

Thanks Brian. I sincerely appreciate your understanding of what I was talking about. I DROOL when I think of "natural" towers thousands of feet in the air and get so frustrated when I read of people doing what you have done. (Some serious envy there) I honestly did not understand that you were talking about EXPERIMENTING with the new technology.

You are of course 100% correct.

Your comments about building a "glorious digital network" and then handing it over on a silver platter are especially apt. Why ARE hams spending THOUSANDS of their own dollars to put these systems in place? Interesting question. My wife is continually questioning my sanity and maybe she is right to do so!

This brings up the question of financing (dreaded thought). I have long considered attempting to duplicate the "voice world" by trying to start packet radio "clubs" to form a financial base. But in the areas that have done this, there seems to be an obstacle in accomplishing anything. By this I mean they seem to need a committee and a vote on EVERYTHING and the result is that very LITTLE gets done. When individuals control the sites it is still hard to coordinate things, but it CAN be done. (This is NOT a slam on clubs, I'm just asking how to avoid the above syndrome!)

Are there any organizational wizards out there that have suggestions in

this area? I think it would be a productive subject to talk about. I am pretty stupid when it comes to raising money and I just DESPISE running around with my hand stuck out.

Just a thought ...

Mark Bitterlich
WA3JPY@WB4UOU
mgb@apg-tecnet.apg.army.mil

p.s. Brian... again... thanks for your MANY contributions in the furtherance of packet radio in general!

Robert,

That's an excellent idea, so hold that thought. I think some means of dynamically working out Po such that each side has a 10-15 dB SNR would be wonderful. You'll probably hear criticisms such as "Yes, but everybody on frequency would have to be similarly equipped", or "SNR estimation is difficult and would complicate the Layer 1 equipment". Both are probably true, but your idea still has just as much merit. Perhaps you could come up with a BER-to-SNR relation to use in such a scheme.

Hello.
I've been reading this newsgroup for a few weeks and have seen little
mention of the types of modulation used at speeds greater than 1200bps.

Is anyone using "standard" V.32 or PEP modems for 4800 or 9600 bps?
It would be nice to be able to use this equiplent because it is cheap and
readily available.

I'm not on packet yet & an wondering where the high speed activity is.
I've beed scanning the bands & hear lots of 1200 bps on 2 meters, and
a smattering of activity on 440 & *nothing* on 902-906. I don't
have any equipment to monitor 220. Is that where evryone is?

   No, I'm not going to ask any really stupid questions. Instead, would
someone point me towards some source of data for up-to-date information on
computer communications via packet radio. I am especially interested in using

TCP/IP (yes, I have heard of KA9Q). Any help appreciated. Thanx.

>Is the tcp/ip only designed for receiving, or is there a way for it to send
>mail to RLI style system for full bidirecitonal mail forwarding?

The mailbox stuff was a hack to make more folks happy about using the package,
since it allows interaction with AX.25 users more reasonably than not.

It does not provide a way to do outbound RLI-style forwarding. You can do this
on a Unix system by running the W2XO PBBS code in tandem with NET, but that's
overkill if you're just looking to pass mail.

Go read the last few years worth of proceedings of the ARRL Digital Conferences
and you will find that this is not a new observation, and that in fact much
of what is happening now on the "bleeding edge" in packet radio is driven by
this realization.

Hi. I'm still here, it's just only every week or two that I have a chance to
read and reply...

The package was a couple of disks available from TAPR, that Andy Freeborn
N0CCZ put together from stuff I gave him. There are some recent things that
are interesting that aren't included, but for a fundamental understanding of
the TCP/IP protocol suite, and the pieces that are important to the base
functionality of Phil's NET package, it's still a good set of docs.

Here's contact info for TAPR:

>Can anyone with an "in" with TAPR (Phil // Brian?) give us the latest
>scoop on the TAPR packetRADIO project?

I'll try.

>Rumor control has it that some of the units are now out in Beta test, and
>while I filled out the little form volunteering for that effort, I never
>received a reply.

No units are in beta test yet. The design is still be bashed about by the folks involved in the project. Progress is being made, but the whole thing has (as usual) taken longer than was hoped/expected. I participated in an effort to sort through the beta applications just after the conference here, and my only comment is that there are a lot more applications than we intend to have beta units for... noone has had a reply, because there's been nothing to say.

I'd guess it'll be at least January before you hear anything positive or negative.

>The big draw on the TAPR unit is its proposed turn-around time and its higher
>power output of 25 watts. Does anyone have any idea whether these units
>are going to be compatible with each other and to what degree?

The anticipation is that all of the direct-FSK units will be able to interoperate. This includes the original K9NG design still available in kit form from TAPR, the G3RUH design licensed by Paccomm, the TPRS (Texnet) board's 9600 modem, and eventually the TAPR unit. There are a bunch of things about the TAPR unit (the output power, multiple frequencies, etc) that I think will make the TAPR design attractive...

>Sooo... Any word on when this unit will be available, and at what cost, or
>answers to any one of the other questions?

There's not much more to be said right now. Stay tuned, I'll try to provide updates as information is available.

>73 de WA2ISE

I think it's a fantastic idea. Maybe it should be incorporated into the
"new" radios that will be coming out soon for 19.2 kbaud, 38.4 kbaud,
etc. Of course, it's probably asking too much to ask most hams to
modify their existing equipment (unfortunately).

I don't think that this is a good idea. If you lower your power, you will
increase the hidden-terminal problem. The problem is that you really can't
compare amateur packet radio which has many stations concurrently using the

same channel in the same geographical area with cellular telephone where is single station with is using the channel in a cell. The whole point in reducing the power of a cellular telephone's transmitter is to prevent interference with adjacent cells and not with other stations within the same cell.

I think the best approach is a full duplex repeater, which would reduce the rate of collisions on the channel by eliminating the hidden terminal problem. Folks that put digipeaters up on huge towers with a very large coverage area are just provoking the hidden terminal problem; I suspect that the community would be better served by a full duplex wide area repeater or many more smaller coverage digipeaters.

Hello All,

I recently got myself a 2-meter mobile unit which I also intend to bring indoors at night and want to run packet.

I was curious about what you thought was the BEST packet box (most usable features), and the one you thought to be the BEST BUY (best $$$/features). I am familiar with the AEA PK-232 and Kantronics KAM, but I would like to avoid overlooking other maybe lesser known gems. Also, aside from most usable features, which one is the most packed with features.

Your help would be greatly appreciated.

Thank you.

Mark.

Automatic power control in packet radio is in fact an excellent
idea, one that has long been used by the DARPA packet radio project
(along with many other ideas that have largely been ignored by
hams). Proper control of power, i.e., using only as much as is
really needed to reach your intended destination, can result in a
DRAMATIC increase in overall network throughput. There are proofs
and simulations which show this, but the result ought to be
intuitively obvious.

The problem with almost every "standard" telephone modem is that
they're just not very suitable for radio operation. They're designed
for fullduplex telephone connections, where you have much more S/N
than bandwidth, and where you can spend 5 seconds to train and
equalize the path at the beginning of each "transmission". Packet
radio modems have to operate efficiently in burst mode (which tends
to rule out coherent demodulation, especially with large signal
constellations) and optimizing S/N performance is more important
than fitting into 3 KHz of spectrum (which also rules out the more
complex signal constellations that are quite popular in high speed
phone line modems.)

Anyone out there with KA9Q's package running on a SYSV unix box willing
to e-mail me a copy?

How easy is/was it to use the package on a system which has other networking
packages (Interactive TCP/IP, NFS) already installed?

Phil,
Although I agree that it appears "intuitively obvious", it would seem
to me that this would only exacerbate the hidden transmitter problem.
Why is this not a problem?

I think there is a fundamental issue here which is important.
The optimum power question is one of adequately getting information
to the other end while at the same time avoiding qrm/collisions
with other stations.

Omnidirectional broadcast is the nemesis of these goals!

At the same time that it wastes power by sending it mostly in the
wrong directions it also qrms others (and removes their ability
to simultaneously use the resource). It does a poor job of getting
the transmit power, and the information, efficiently to the destination
(inefficent use of hardware and spectrum resources).

My opinion is that omni broadcast is a curse we won't soon escape
but we don't want to expend much of our spectrum resource on it. This
means we don't want to use it for high speed data. It also means
we don't want to use it over large geographical areas which have, or
potentially can have, a large number of users. Each additional CSMA
user effectively divides the resource up into smaller chunks for each
user. High level transmitters effectively deny the bulk of the resource
to users. As long as we don't increase the amount of spectrum wasted
in this manner, that is as long as we don't use spectrum which could
have been used better, its not such an issue. 1200-9600 baud operation
at vhf probably can continue but let's not propagate this inefficient
use into areas which are our sole resource for doing things right and
efficiently. Reducing power on an omni transmission helps but is
fundamentally a poor use of resources at best. To get high speed information
to a large number of users we *must* make efficient use of resources.

We simply must go to point-point links to make optimum use of hardware
and spectrum. This means higher UHF and especially microwave. It also
means we have to find routing protocols which efficiently get the
information to the destination without unnecessarily using network
resources.

Not only do highly directional beams get more information rate per watt
to the user they also allow frequency re-use in a given geographical area.

The problem with msgget in both XENIX (r) and Microport is much simpler
than most of us may think: the XO hook file appears to have been debugged
on a 32-bit machine (if it ever worked), and the author forgot to declare
ANY longs that are needed. The msg key (first parameter) needs to be long,
and I remember a few other places (but not exactly where) where either
%l.. or (long) needed to be. The other authors in "net" have generally
been careful of this.

I used:
long msgkey = *(long *)" BBS";
with msgkey, msgkey+1, msgkey+2, msgkey+3 for the keys for the 4 queues.

Also, I don't have W2XO's code, I used the hooks for an on-line database
to support a 100-mile running race (which worked pretty well on the event).

I say amen to this, brother. A system of local full-duplex repeaters
would inherently *double* the throughput, even without the gain in
collision avoidance because each packet appears only *once* on the
channel (input or output) instead of *twice* as it is sent and then
digipeated or net/rom'ed out again. The fact that everyone on the
repeater hears the same thing makes the collision avoidance algorithmns
work properly, as W3YMH pointed out, which is a further gain.

The sad part of all this is that , after just posting similar sentiments
to the tcpgroup, I got mail back from a fellow on the West Coast who
lamented that they had, in fact, had such a repeater going in that area
for a couple of years and *no* *one* *used* *it* ! Seems that it's a
great idea, but the average "plug and play" tnc user just doesn't
realize why it is a great idea, so they just continue to qrm the
input frequency by running simplex.

So, how does one get the message across? Repeaters would really be
the way to go, but just a few folks who didn't get with the program
would ruin it for the rest, probably without realizing it.

Please don't. The tcp-group mailing list is for people who are actively
working on new developments in ham radio networking, particularly those
who are promoting the use of the TCP/IP suite of protocols.

It is NOT the place for user hand-holding. Considering the small amount
of traffic and the large listening audience, it would seem to me that
this newsgroup (and it's associated Internet mailing list) is the best
place for such questions.

%
Beams, rotors and beams.Maybe beam headings should be part of the works.
Lat the software rotate the BEAM as well as adjust power. Why radiate
your QSO and create QRM in a direction that's not needed. If today's
software (packet) could handle the beam via a parrellel port (ie printer)
and a cheap rotor interface, the 01 qrm might be a lot less.
If somebody in buffalo is talking to Canada, I hear them in rochester,
this ties up the packet channel needlessly in the this area, or am

I missing something here. Just another HO.

>Why do we want to build it?

This strikes to the heart of everyone's differing expectations of ham
radio.

The techies want to build it because it's a neat hack.
The original packet implementations - slow and primitive as they were -
were still way ahead of their times: neat hacks. The TCP/IP stuff on ham
radio is a neat hack. 56 KBPS, and the upcoming megabaud efforts, are
neat hacks. To me, this has driven most of the packet development.

The congestion I see on 145.0x here is driven by a second group: the
ragchewers. They don't care if something is a neat hack. They want to
fire up their radio, and a couple of other pieces of gear, and yak. If
it isn't easy to use to the point of being transparent, they don't want
it.

The last group is the public service types. They want it to be reliable.
They don't want neat hacks until they've been beaten into submission and
bulletproofed.

The problem for the techies - who by far and away are the builders of
the network - is that they're grossly outnumbered. Dan's experience is a
perfect case in point: he's the only techie around there, and so nobody

else wanted to play with his neat hack.

No, I don't have much of a suggestion for improving the situation; that
delves deep into people's motivations, and any long-term reader of these
groups knows I'm not much at motivating people. :-)

I have been playing around with the ax.25 stuff for a while now, and would like to get into some more advanced stuff. I ftp'ed Phill Karn's TCP/IP package from, I think loui.udel.edu, and looked at that. It is a very nice package, and i have some questions about running tcp/ip on top of a tnc.
First of all, I am located in a small college town south of Portland, Oregon. I have posted some messages on the local packet bbs's asking about any other stations running tcp/ip, but to no reply.
It would not be of any use to me to run it, if there aren't any other paople running it, or at least if there is a gateway that i could digipeat to, I think. Does anybody in the Portland Oregon area know of any tcp/ip activity and is there any coordination of IP addresses ?

Second, I wonder if the version of tcp/ip i have is the most recent; what is the best place to look for a recent version ? (ftp site; or TAPR, tucson maybe ?).

Thanks a lot,

Gateway: The ARRL Packet Radio Newsletter - Volume 6 - Number 3
The American Radio Relay League, 225 Main Street, Newington, CT 06111

Edited by Stan Horzepa, WA1LOU - - - - - - October 20, 1989

LOWER-LAYER IMPROVEMENTS DOMINATE 8TH COMPUTER NETWORKING CONFERENCE

The ARRL Amateur Radio 8th Computer Networking Conference was held in Colorado Springs, Colorado, on Saturday, October 7, with approximately 150 attendees. In conjunction with the conference, the Rocky Mountain Packet Radio Association (RMPRA) held a packetfest on Sunday. The ARRL Digital Committee met that same day. If there was a theme to the conference it was the need for improvements in the lower layers of the protocol stack. New or modified level 1 and 2 packet-radio protocols were discussed in several papers, as were improvements to the radio systems in use.

A proposed broadcast protocol was presented by Gordon Beattie, N2DSY. This protocol is implemented in the BBC software package, which is part of the Radio Amateur Telecommunications Society (RATS) ROSE system. Improved performance of the AX.25 link-layer protocol was proposed in papers by Lyle Johnson, WA7GXD, Eric Gustafson, N7CL, and Detlef Schmidt, DK4EG.

On the radio front, the fast-approaching advent of high-speed packet-radio hardware (see related story entitled "Awesome I/O Card in Beta Test") brought forth much discussion of the need for coordinated network efforts, culminating in a continental high- speed network. To whet the appetites of the packeteers present, Bdale Garbee, N3EUA, displayed the 10-GHz, 1-Mbit/s packet-radio system developed with Glenn Elmore, N6GN. HF wasn't neglected either, as the HF packet-radio design quest announced in May, 1989 QST begins to bear fruit (see related stories entitled "ARRL Digital Committee Advances AX.25 V2.1, HF Project" and "Call for Participants in HF Diversity Tests").

AWESOME I/O CARD IN BETA TEST

At last year's Computer Networking Conference, Mike Chepponis, K3MC, presented a design for the "Totally Awesome I/O card." (Mike lives in California now... or couldn't you tell?) Since then, the Awesome I/O Card, as it's known for short has been under development at Digital Radio Systems, Inc (DRSI), in Clearwater, Florida. DRSI founder Andy DeMartini, KC2FF, brought copies of the "Product News Brief," dated October 7, to the Conference.

The improved Awesome I/O Card consists of a NEC V40 CPU running at 8 MHz, two 1-Mbit/s I/O ports with direct memory access (DMA), up to eight 19.2-kbit/s ports and as much as 512 kbytes of dynamic RAM and 128 kbytes of EPROM. The card plugs into an IBM PC/XT/AT or acts as a standalone controller.

Software will include an EPROM version of TCP/IP. Other packet-radio networking providers are working on versions for the Awesome I/O card too. For more information, contact DRSI at:

DRSI
2065 Range Rd
Clearwater, FL 34625
telephone 813-461-0204

ARRL DIGITAL COMMITTEE ADVANCES HF PROJECT, AX.25 V2.1

At its meeting on October 8, the ARRL Digital Committee discussed the potential for vast improvement of HF packet radio. They defined four specific areas to improve: modem design, protocols, use of diversity techniques, and network management. Each of these areas will be addressed with ARRL support as needed by issuance of grants to developers. (See "The Great 1989 HF Packet Design Quest" in May, 1989 QST.)

The proposed update of the AX.25 protocol to V2.1, reported in the October 21, 1988 issue of Gateway, was adopted by the Digital Committee. The final draft of the new protocol specification is being put together by Eric Scace, K3NA, and Terry Fox, WB4JFI, and will be reviewed by the Committee prior to publication. The changes made to AX.25 should not affect interoperability with existing V2.0 implementations. The Committee would like to thank all those who commented on the proposal for their contributions to the final version.

CALL FOR PARTICIPANTS IN HF DIVERSITY TESTS

One of the techniques that shows great promise for improved HF packet-radio performance is diversity reception. Used for years by military and commercial stations, diversity is the technique of receiving the same signal on two different antennas. The antennas may be separated in space, different in polarization or use different angles of arrival for the received signal. Steve Hall, WM6P, has been testing some of these techniques and reported encouraging results at the 8th Computer Networking Conference. Steve has agreed to organize a group to work in this area to find usable approaches for HF packet radio. If you are interested in assisting in this effort in any way, contact Steve via mail or packet radio at:

Steve Hall, WM6P @ N6BGW
664 Bristol Av
Simi Valley, CA 93065

(Special thanks to Jon Bloom, KE3Z, who provided the preceding reports from the Conference.)

TCP/IP HF EXPERIMENT

Since last June, MITRE Corporation has been performing an ongoing set of Near Vertical Incidence (NVI) HF sky-wave communication experiments to determine the feasibility and utility of using the HF channel for TCP/IP network operations. These experiments were conducted using existing packet-radio hardware and software, ie, off-the-shelf TNCs and radios and no sophisticated HF modems. The system software is the KA9Q Internet Package. The terminal hardware employed IBM AT computers, Kantronics KAM TNCs and HF NVI antennas.

In addition to demonstrating the utility of the HF channel for TCP/IP operation, a main objective of the experiment was to establish and assess the performance of a pseudo-optimum set of NET and AX.25 parameters for HF operation. "Optimum" in this context means maximum throughput and channel efficiency. The results of this experiment would then be used to support an analysis that predicts system (network) performance when more advanced hardware and improved protocols are employed. The experiment serves as a convenient method for assessing HF network performance in a real world channel and that may be used to support and validate simulation methods.

Approach to the Problem

To achieve the above goals, we first defined a worst case HF link scenario, which happens to be an NVI link, ie, between 0 to 200 miles. NVI links are forced to utilize low frequencies because of the low MUF resulting from the NVI geometry. These links are plagued with severe multipath (more pronounced at night) and high D-layer absorption during the day. They also suffer from high electrical storm burst noise in the summer. The philosophy here is "if it works on an NVI channel, it will work better on long- haul channels."

Next, the fade and burst statistics of the channel were used to determine the average usable baud rate and optimum packet length for a nonadaptive system. With a handle on the baud rate, optimum packet size and burst error statistics of the channel, both network and link layer protocols may be tailored for maximum efficiency. A truly optimized system can only be realized through simulation convergence with known network constraints. However, there are some parameter adjustments that can be made to the system that will put us in the ball park if a simple network architecture

is assumed. For starters, Phil Karn, KA9Q, and Brian Lloyd, WB6RQN, have shown in their paper "Link Level Protocols Revisited," that regardless of link quality, maximum channel efficiency is realized when a stop-and-wait ARQ protocol is used. The current AX.25 TNC is easily configured for stop-and-wait by simply setting the MAXFRAME parameter to 1.

In our experiment, the system was operated in unconnected or datagram mode. This provided us with a measure of link performance in terms of network layer parameter settings. Also, by using the datagram mode, we were able to avoid time-outs and disconnects resulting from AX.25 send queue bottleneck, sometimes encountered when interfacing with high speed network hosts. We were also able to achieve greater throughput on good quality links. The stop-and-wait ARQ in this case was implemented at the network level by simply setting the TCP WINDOW parameter to MSS (ie, a window size of 1).

In their paper, Karn and Lloyd also advocate the use of a connectionless ACK-ACK link level protocol to improve the efficiency of noisy channels like HF. Our analysis fully supports their conclusions. However, the ACK-ACK protocol is not easily implemented with the present hardware and software and would not provide much more information on the network performance potential than what could be derived analytically. Therefore, we did not attempt to implement the ACK-ACK protocol in this experiment. It is, however, a worthy topic for further study.

The appropriate packet size for the NVI links may be estimated from the link burst error statistics resulting from multipath effects. My analysis indicates that there is a high probability that selective fades will "hit" packets at 12-second intervals on the average. Keeping the packet length about half of the hit interval significantly increases the probability of successful delivery on a single try. Thus, our reason for selecting a 228-byte (6.08 second) duration packet for the experiment.

TCP/IP HF EXPERIMENT - (Continued)

System Parameters

The following is a summary of the pseudo-optimum NET parameters derived from the analysis and used in the HF experiment.

```
 Average Usable Baud Rate = 300 baud binary FSK 200 Hz shift
         (set by estimated multipath)
 Optimum Packet Size = 228 bytes (duration 6.08 seconds)
 MTU = 196 bytes
 MSS = 156 bytes
 WINDOW = 156 bytes (window size of one)
 AVERAGE RTT = 9 seconds (measured)
 AX.25 MAXFRAME = 1
 AX.25 TXD = 50 ms
 AX.25 P-PERSIST = (1-persistent)
 AX.25 SLOT TIME = 0
```

Expected Performance

The above parameters result in the following performance estimates for an NVI HF link operating at 3.6 MHz with an NVI ERP of +26 dBW (ie, 100 watts to a dipole mounted about 1/8 wavelength above average conducting ground).

```
 Average Received S/N = 65 db Hz => 38 dB SNR in 500-Hz data
  filter (mid-day, noise = QMN + 10 dB) Note: QMN = Quasi-Minimum
  Noise (see NELC Report 1712, 2 June 1970) (derived from IONCAP
  analysis)
 Probability of Packet Delivery
 For 1 try = .41
 For 2 tries = .74
 For 3 tries = .87
 Average link reliability = 70% (based on PING efficiency)
  (during usable periods)
 Max Possible Throughput = 17 bytes/sec/link (ideal channel,
  i.e., no fades, burst errors or contention)
 Average expected throughput = 4 to 6 bytes/sec
```

Measured Performance

Data was taken on an NVI link between Bedford and Norfolk, Massachusetts (40 miles) several times daily over a total of 120 days. The average throughput under typical conditions was measured at 5 bytes/second peaking to 9 bytes/sec under the best of conditions. The corresponding link reliability (the PING efficiency) ranged from 55 to 95%. The average S/N was 63 dB Hz (not counting electrical storms). The measured performance is in very close agreement with the above predictions, thus giving credence to the analysis.

The lowest S/N never dropped below 53 dB Hz (27 dB SNR) (not counting electrical storms). SNR is not generally an issue for NVI links except for periods of high D-layer absorption resulting from major solar flares, the major culprit is multipath. Increasing transmitter power won't help. In fact, it could exacerbate the situation.

Areas Requiring Further Work

There are three areas in need of enhancement and, if implemented, would significantly improve HF link reliability and throughput.

The first is the link level protocol. It appears that a significant improvement in channel efficiency is realized through the use of an ACK-ACK link layer protocol. At the top of my "wish list" is to see a KISS mode compatible link-level driver module written for the KA9Q package that would provide an ACK-ACK protocol capability while maintaining backwards compatibility with the existing AX.25 level 2 protocol. An experiment similar to this then could be set up that would assess improvements in a real world environment.

The second concerns the network layer back-off algorithms. The performance data indicates a need for a "back-off" algorithm that is more suitably tailored for the HF channel statistics and one which is capable of

differentiating between congestion and HF channel related burst errors. This is not an easy task. This algorithm needs to be more aggressive when adapting to HF channel related noise and in such a way that it would not compromise congestion control.

The third and, perhaps, the most effective enhancement would be the use of a more robust modem. The advanced modem would incorporate 8-level PSK modulation, Forward Error Correction (FEC) and variable depth interleaving. Such a modem would be capable of providing up to 2400-baud operation over a typical 3-kHz HF radio channel. Such modems do exist, however, they are far too complex and expensive to be considered for Amateur Radio use at this time. Perhaps the DSP modem technology currently being explored by other amateur packet-radio enthusiasts is the key to an affordable and timely modem solution for the HF packet-radio community.

TCP/IP HF EXPERIMENT - (Continued)

Near Term Utility of HF for TCP/IP

At a recent New England TCPers meeting, interest was expressed in using HF radio for long-haul SMTP type TCP/IP traffic. Now that the sun spot cycle is on the climb, more and more long-haul interference-fee channels having fade statistics that "may" be able to support up to 1200 bauds with conventional binary FSK modems are becoming available. These links remain viable for a significant part of the day. Although they experience slow fades, the deep fade duration is relatively short-lived compared to life time. The long-haul links are also less prone to multipath contamination than are the NVI links used in this experiment. However, they are much more vulnerable to the hidden terminal syndrome. Whether or not 1200s baud is supportable by these links is primarily governed by average round trip time, which, in turn, affected the T/R delays of typical HF radios in the path. These delays are generally twice as long as those of VHF systems. Furthermore, the HF modems contained in some of the existing TNCs, such as the Kantronics KAM or AEA PK-232, have excellent predetection filtering that is much better suited for HF channel operation than those common to the standard 1200-baud port. The equalization for a typical VHF radio is significantly different than that required for HF. Unlike the NVI links, the long-haul multi-hop link budgets are such that they require a matched filter to maximize the SNR. For these reasons, I feel it is best to stay with 300 bauds on HF.

The concept of a system that optimally exploits the long-haul path characteristics for slow TCP/IP traffic handling is intriguing. I feel that with a judicious frequency management plan and the use of NET/ROM for path diversity, it is possible to maintain network connectivity on a 24 hour/day basis. A very interesting and productive experiment would be to establish a 5-node HF TCP/IP NET/ROM network that would span the country including nodes in Alaska and Hawaii.

If anyone has any ideas on this, please respond to the author, bob@w1imm-2 via rich@wa1equ. Perhaps, we can form an HF working group of sorts.

by Bob Levreault, W1IMM from The New England TCPer

MICROSATS PASS ENVIRONMENTAL TESTING; MUST WAIT FOR LAUNCH

All four of the AMSAT MicroSats (PACSAT, LUSAT, DOVE and WEBERSAT) completed the necessary environmental tests, that is, thermal vacuum and vibration tests, with flying colors. This means the MicroSats are now certified to fly aboard the Ariane IV launch vehicle.

Official word received from Intelsat and Arianespace representatives indicates that the launch may be delayed at least four weeks from the original date of November 10 to correct problems with the Ariane IV space vehicle. The AMSAT launch team will use this time to perform additional system level and software testing on the satellites.

Well, what does it take to put a telnet PAD in TAPR TNC-2 EPROMS? Is there
any code in the public for running the Z80 support chips in the little
monster? How little/how much of the KA9Q package needs to go in there?

While I'm raving, has anyone written a Forth interpreter that can run
on a TNC-2? If so, it should take a couple of weeks to get a PAD running.

Has anyone published an article or app note on programming the TNC-2?

Twisty little passages in my enquiring mind want to know.

Pete, you are absolutely right about the first argument to msgget(). I
was *convinced* it was an int (it's actually type key_t, which I thought
was an int, but, low and behold, it is a *long*. The easiest fix for
this is to merely append an 'l' or 'L' to the character constants
in ax_mbx.h.
Yes, it *does* work and has been for the last six months on my
MC68010 Convergent Miniframe(which is a 16 bitter!).

> and I remember a few other places (but not exactly where) where either

> been careful of this.
>

Uh, like where? The only longs that live anywhere in ax_mbx.c are
the message types, and these are all cast to long where needed. I looked
through the code and can't see anything obvious. Unfortunately, I don't
have access to a Xenix or Microport system to see what happens. I would
appreciate if you or someone who does have such a system would give me
some specifics.

> I used:
> long msgkey = *(long *)" BBS";

OK, I see, pretty neat.

Incidentally, there are *many* bug fixes since the code that was
distributed at Dayton with the .1 version of 'net'. I will put the
latest bbs code out on cs.pitt.edu in the ftp/pub/ka9q directory as
'xobbs.shar.Z' .

73 and thanks Pete,

11 November 1989

ROSES-1 Schedule of Events

As of 28 October 1989

ROSES-1 will be held on the 11th of November 1989 in the Student Center of the New Jersey Institute of Technology from 8AM to 6PM. Talk-in will be on 145.19 (-600) and 147.225 (+600) MHz. For further information contact Gordon Beattie, N2DSY at 201-387-8896 or via packet n2dsy@kd6th.

This event will include talks for the new and experienced operator. All software discussed at the sessions will be available for free. (plus cost of media - so bring 5-1/4 or 3-1/2 inch disks)

Also: Question and Answer Sessions,
Demonstrations,
TNC Tune-up (bring TNC and radio)
Equipment Literature,
Software Distribution,
License Examinations.

NOTE: ALL Sessions include a Question and Answer period.

Plan on dinner with your fellow operators!

For further information contact:

General: Gordon Beattie, N2DSY 201-387-8896 n2dsy@kd6th
Testing: Pete Adley, K2MHP 201-796-6622

The tentative schedule follows:

	Activity 1	Activity 2
08:00	Coffee, Tea, Doughnuts	License Exams Start
09:00	Introductions, Announcements	*
09:15	How to Set Up a Packet Station	*
10:00	Operating a Personal Mailbox	*

```
                                        *
11:00    Networking with the           End

Has anyone successful hooked up a Cambridge Z88 to Heath's
"Pocket Packet" TNC, and if so, what cable pinout/communications
parameters did you use?

Thanks to all who responded. Since I also received several requests asking
me to relay the results, here they are:

  1) The cable from the Z88 to the Heathkit Pocket Packet TNC:
     Z88   TNC
 male DB-9   male DB-25
     1   ->   not connected
     2   ->   2
     3   ->   3
     4   ->   20

```
5      ->    5
6      ->    not connected
7      ->    7
8      ->    8
9      ->    not connected
```

A little strange, perhaps, but it works. Using a shielded cable is highly recommended.

2) One undocumented "feature" of the Z88 is its inability to handle communications at 7 bits/byte, Even parity, 1 stop bit when receiving data. You can "set" the parity to "Even" from the PANEL (square-S) but it only affects outgoing bytes. All incoming bytes are still interpreted as 8-bit bytes, hence, about half show up as garbage.

   The solution: First hook up your TNC to a "normal" computer that is comfortable with 7,E,1 at 9600 baud. Then issue the PARITY 0 and AWLEN 8 commands.

   Turn the TNC off. Next, set the PANEL on the Z88 for parity "None" and the baud for 9600. Start the TERMINAL application from the index menu.

   Plug the TNC into the Z88 and turn it on. You should now see the Heathkit welcome message.

3) "delete" is entered as CTRL-H or SHIFT-DEL.

4) To copy to a log file, use "square"-"plus sign"-S . This will copy the data into a file "S.SGN". To stop logging, use "square"-"minus sign" -S. See p. 192 of the Z88 user manual for more info.

The Z88 runs about 6-8 hours per charge on 4 AA nicads, and the Icom 2AT with a BP8 has been going for over 12 hours air time so far. Then again, I've mostly been listening rather than transmitting. The internal battery pack for the pocket-packet only lasted 2 hours with the LEDs enabled; another 4 AAs external should take care of it.

If anyone else sets up a Z88 packet system, please let me know. I am interested in hearing how others cope with power-supply differences and cables.

-Tom

Awhile back I remember reading about a ROM for TNCs for software for a PC
that implemented a conversation function between multiple AX.25 sessions
on a channel (ie, round-table type QSO's).... Anybody have the scoop
on this? We could use something like this here in MSP where everyone is
trying to do keyboard to keyboard sessions with everyone else...
Any info would be appreciated. Thanks and 73, Chris

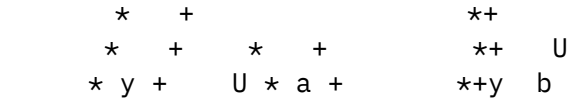
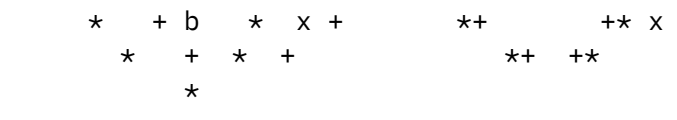
Users using directional antenna to reduce "hidden transmitter" problems.

All you packet grurus would have to tell me if this actually would make
sense, but a packet user who uses only one PBBS could use a somewhat
directional antenna that would distribute his signal over the PBBS's
service area, and no signal outside that area. All other users would
hear him, and not transmit. And he wouldn't transmit a collision with
another user on the far side of the service area. And he would be less likely
to interfere with
some other user outside of the area
trying to use a nearby PBBS in a neighboring area.





+=fringe of Users signal coverage (directional)
*=fringe of PBBS signal coverage (omni-directional)
y=another user in the PBBS area (assume similar patterns of coverage as U,
omni-directiona in left diagram, and directional in right)
x=another user outside of the PBBS area
a=another PBBS outside of the first PBBS area

Of course, getting most users to install an appropriate directional antenna
would not be easy.

Packetradio power output control.

some thoughts on a possible algorithm for automatic power level adjustment for
a packetradio. At least on VHF and UHF.

1: Station A would initiate connection, using full power.
2: Station B would measure station A's signal strength (like an S meter), and
tell A that it can reduce so-many dB its power, when B confirms the
connection. Station B uses full power.
3: Station A would measure station B's signal strength, and tell B that it can
reduce its power by so-many dB. A uses reduced power at this point.
4: Both stations are now operating at reduced power. Conditions can change,
so if A finds that it tells B to re-try a lot, A will tell B to increase power
some (maybe by one step of attenuation, like 1 or 2 dB).

I suppose that the radios could store the power values used for commonly
contacted stations, so one could initiate contacts with less than full power.
Also, the radio recievers would need some sort of calabration as to what

recieved signal strength is needed for an acceptable connection. Like "S-3 is the lowest level I can reliabily use". Unless one can measure bit error rates easily instead of S units (signal strength), in which case one could set an acceptable BER and adjust power untill you get that BER. Then you could avoid tying up too much area of
a channel.

As someone mentioned, this idea could make worse the hidden transmitter problem. But you could avoid having two big-mouth stations next door to each other from tying up a large area of a channel. I don't know how to decide this question (not being an expert).

I think there are some uusused bits in the packet headers that could be used for a purpose like this. If not, (or we want to save them for a better use) I suppose that special codes could be made up for this. (I'm NOT a packet gruru! I'm more of a hardware analog hacker than a software type, anyway).

It would probably be better to have the station that is re-trying go to
full power and then re-negotiate the power setting. This could save
junk packets being sent out while "hunting" for the right power level.
This probably implies that it would be better to have the power setting
done with new transaction types rather than added to connect/ack
messages. Maybe it would be useful to have a bit in connect that means
the station is capable of negotiating the power level though.

I don't think there is a "solution" to hidden transmitters. Even with
directional antennae, you have the problem of stepping on someone who is
in your null. In the end, it might be better to listen on a
non-driectional antenna with a preamp and transmit on a directional
antenna with "appropriate power." (This as we move toward full-duplex,
self contained packet stations.) Even then, there are scenarios where
there will be hidden transmitters.

I am just getting into packet radio (Yeah!). I just got a used MFJ-1270 TNC-2 and
I want to interface it to an ALINCO DR-110T 2-meter transceiver. Has anyone used an Alinco for packet, and if so, how did you setup the cables? The only thing I am not sure about is that the Alinco has a general ground and a seperate ground for the Microphone. The MFJ only has a common audio/PTT ground. How can I handle this difference? Any suggestions are greatly appreciated. Also, any other things to watch out for would be appreciated.

Also, does anyone know what the current (highest) rom revision level is out for the MFJ-1270? Can I get new rom's from MFJ? I want to make sure that MFJ is as up-to-date as possible.

Thanks in advance,

I have recently set up a 2m packet station in Midland, 80 miles north
of Toronto. I am looking for some packet users with whome to
communicate outside the immediate area.

My callsign is VE3XYM and my local auto-forwarding PBBS is VE3KYT-1.
I will find any mail left there. This message is from CRS in Toronto,
and my usnet address there is clinton.evans@canremote.uucp. It would
be good to hear from you.

Regards

Clinton

   Hello All,

Well I can't offer FTP for anybody, but can offer dialup&download or UUCP
access to any of the KA9Q software. Since it has been a while, and my system
was down due to misfortune for about seven weeks (bad drive :-( ), I will
post the information on how to access my system to this group again. I try
to keep all the KA9Q software and it's variants on the machine...

+--+

HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the Amateur Community (but there is other stuff on-line). As of now I have not attempted to promote this system any place except in the amateur channels (PACKET, USENET, & word of mouth), and will continue under this policy, as I hope to keep it oriented toward amateur radio. The various software for UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through user support I hope to keep the latest and greatest ham software on-line. Below is the information that is needed in order to access the BBS via Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
Login: bbs
Number: (301)-335-0858 -- 1200 & 2400 (Non-MNP)
Number: (301)-335-1955 -- 2400 (MNP), 9600 & 19200 (PEP) [V.32 soon]
Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS)
IP Address: 44.60.0.1 {wb3ffv.ampr.org} [for FTP access on 145.550 mhz ONLY]
Misc. Info: Machine is an 80386 computer running UNIX V.3.2 and features 700
Meg of on-line storage. Most transfer protocols are available!!
MNP up to Level-5 is supported.

I attempt to keep the latest and greatest HAM software on-line, and encourage all to upload anything new that they come up with, as it is of benefit to all. Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.12)
W0RLI BBS for the PC (Versions 6.xx, 7.xx, 8.xx, 9.xx)
MSYS BBS for the PC running KISS TNC's (Version 1.05)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01)
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called

'FILES', and it is located in the /usr/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic

This will move a copy of my files listing into your uucppublic directory. If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

I'd like to place several exclamation marks behind this, because some
hams tend to 'forget' these basic rules of physics.

Derived from that we'll get the next basic requisition of a dc-component-
free modulation scheme (and low-frequency-free). You can't switch
faster (receive <-> transmit) than the lowest modulation frequency
you'd like to xfer.

And this is a basic problem of simple FSK modems
(k9ng/g3ruh modems   for example). Low-frequency components can NOT be
stripped by means of a scrambler.

And because of all these criterias I developed a PR modem which
utilizes a 4-phase DPSK scheme. It's free of any dc-component so it
synchronizes/ trains within 5 msec @ 4800 bps or < 2.5 msec @ 9600
(works at higher bitrates too, but signal width increases analogous).
No external squelch is required and S/N is better than on some XR modems
(see one of the preveous digital commitee proceedings):
 < 18dB @ 10^-6 BERR.
Development of these modems startet late 1986 and boards are
spreaded since 1987.

But high speed xfer isn't a simple task to do. Otherwise it would have
been done long time b4.

I have been working on some small development projects in central
america as a volunteer. Communication is a big barrier to doing

the work remotely. I'm not a ham, yet, but have considered getting
a license for communicating with our counterparts abroad. Does anyone
have experience or information in using packet radio and fidonet
communications in an international context? Are there legal issues?
Would satellites be necessary? If so how would they be used?

>Is there a description of the Net/Rom protocol available anywhere?

   The only "official" description is of the header formats, and is
in the NET/ROM manual. This is not the same as a protocol specification.

>I know that there is some Net/Rom stuff imbedded in KA9Q's TCP/IP package
>written by W9NK. Where did he get the info on the Net/Rom internals?

   I started with the header formats, and developed an understanding
of the network layer by watching packet traces and fooling around. The
network layer is much simpler than the transport layer. When I did
the transport support I used the sliding windows sequenced packet protocol
from Tanenbaum ("Protocol 6") with some slight modifications to sequence
number handling, and a fairly clever (I think) original algorithm for doing
exponential backoff in the presence of out-of-order acknowledgements.
Adding exponential backoff really improves the transport protocol. One of
the real numb-nuts features of "classic" NET/ROM is fixed transport
timeouts. I can't believe anyone thought that would work in a
radio network. Luckily transport timeout handling is something you
can add and stay compatible with existing implementations.

   Transport setup and teardown is very badly done in NET/ROM, and
the way it works is not obvious. It would be very hard to get a picture
of the boundary conditions by observing normal network behavior. Here

is one place I had to crib some details from TheNet, although my
implementation is a bit different.

>I am interested in writing some stuff that interfaces with Net/Rom and am
>looking for some sort of "standard" (though I suspect this may be wishful
>thinking on my part).

   If the stuff you're doing is non-commercial you may use my C code
from the KA9Q package as long as your software acknowledges the source
of the NET/ROM support in a banner somewhere (e.g. the startup message).
At the very least you can read the code, which is several orders of
magnitude more lucid than that in TheNet.

   By the way, please don't ask me for a copy. I no longer have any
of the code on my drives, having given up packet radio until such time
as 1200 baud half-duplex is a distant memory.

In my NET/ROM manual, the complete protocol spec is given.

W9NK did a totally independent derivation of NET/ROM from this spec.

Assuming omni transmit antennas with 1 W ERP and the transmitter not
buried inside a building and a 1 Meter receive antenna:

running this at 900 mHz the 1 Meter receive antenna has about 17 dB

of gain, for a separation of 10 kM (I just picked a number)
 "path loss" is about 111.5 dB so power at the antenna
terminals is -81.5 dBm. KTB in 1 MHz BW to support? 1 Mbps is -114 dBm.

This leaves 33 dB of S/N to make up for non LOS paths, increase noise
floor from all the other blasted 1W spread sources etc etc.

Frequency is not an issue here (as far as "path loss" goes) because
we are radiating constant flux, 1 W ERP, and receiving with constant
physical aperture, 1 Meter diameter. "path loss" goes up with frequency
but antenna gain goes up also for the constant size and they cancel.

Actually using 5700 MHz would be better because if we can still generate the
1W ERP (I think it has to be 1W of RF and an omni antenna, not 10 mW and
20 dB gain but I'm not sure) the receive antenna provides a lot lower
beamidth and discriminates against the other QRM.

It looks like we could support full Ethernet speeds on a 10 kM path and
still have 10 dB of margin above threshold for tolerable BER.

Amazing, isn't it?

I know of FANSI.SYS (Fancy ANSI driver) and NANSI.SYS (New ANSI driver?), but it has been at least three years since I tried either of them. With either of these, you would probably still have to re-define the keys (the same way ANSI.SYS will let you re-define keys) to make a real VT100-looking terminal, and that will break some MS-DOS programs that expect standard IBM-PC function key sequences.

Ed, if you load ANSI.SYS or any of the similar packages (NANSI, FANSI, etc)
from config.sys before running net, net will happily pass the escape sequences
through. There are a couple of characters that are trapped to prevent chaos

on a raw Dos system, but I routinely run emacs over slip using the DoubleDOS
version of ansi.sys with no great difficulty.

I can't imagine it will take that long, unless you insist on staying only
on the 144 Mhz band. The higher bands have the space for less efficient
(in terms of bits per square meter) modulation and transmission, so the
faster bit rates will surely be seen there first.

Still 2400 baud is readily available now.

I am fairly sure at the present time that a Kantronics TNC is the one I would like to get, but I am not sure yet which one:

The KPC-4 is a dual port TNC, a feature I want to have.

The KAM has two ports, and advertisements say it is HF+VHF capable. Does that mean one of them will be only for HF while the other is for VHF?

I'd like to have some of the other features of KAM, but I want dual ports that will both be concurrently operating on VHF.

Does anyone have these radios and can explain what they REALLY do as opposed to what the "slick ads" and "glossy brochures" imply?

I am interested in links to packet radio. I Would like to send some mail to some folks tied only to packet. Any help would be appreciated.

send advise to

While I understand that Dan has some immediate family time requirements, and
I'm willing to "let him off the hook" since he's already contributed a neat
hunk of code to "the cause"... but...

In general, I think this attitude STINKS.

Why should I get excited about building a high-speed network, so that when
throughput "is up to reasonable levels", you can just hop in and play for free?

This is a fundamental stumbling block towards developing higher speed network
facilities! I'm going to keep working regardless, but I *need* your help to
get enough critical mass of folks to build (and maintain!) a high-speed
amateur data network.

"We have the technology"... what we don't have is a large enough group of
committed folks to make it really happen...

The original protocol development was done on Xerox 820's under CP/M (yes, it has been a while!)... the code was written in Manx Aztec C for the Z80. It has not been touched for years, and I have no idea where you'd find a copy. And even if you could, you wouldn't want it... it was a *very* rough initial implementation.

Those who were at the ARRL CNC (5th?) in Orlando will remember my little 32016-based 4.2bsd box in the back of the room, slip'ing away to a pair of 820's...

Thanks to all who replied to my query on the Net/Rom protocol. To summarize:

- The protocol *is* documented in the Net/Rom manual. However, the documentation is not complete enough to be considered a "specification"

- There is an implementation of the Net/Rom protocol written by Dan, W9NK inside the KA9Q TCP/IP package.

- And finally, there is the German commented 'C' source for TheNET, the Net/Rom clone/rip-off (depending on your point of view). Perhaps someone could take this code and write a description of the Net/Rom protocol complete enough to be considered a specification. I could do this, but it would put any future Net/Rom code what I would write under a cloud...

And just a few of my own observations:

- I was suprised to find out that Net/Rom is a datagram style network with an end-to-end transport protocol on top. For some reason or other, I had always assumed that Net/Rom was a virtual-circuit style network.

- I was also suprised to see how dumb Net/Rom was in some areas. Dan, W9NK,

addressed some of the shortcomings (like adding exponential backoff for timeouts, etc) in his implementation.

- Advantages I see (compared to other networking protocols):

    - It runs on minimal hardware (TNC 2 box). Also, all of the networking stuff is in the switch nodes, the user's nodes don't even have to know about the prococol. However, you can use only the datagram layer (say, for IP) if you want. Or, you can go all the way and implement the Net/Rom transport protocols on your user node.

    - You can "see" the innards of the network and play with the switches: IP and ROSE attempt to make the network as transparent as possible, which is all fine and dandy, but kind of boring.

    - Net/Rom works farily well NOW, even with its shortcomings. With the shortcomings fixed, it should work even better.

- And, disadvantages (again as I see):

    - No "no strings attached" implementation for the TNC 2 box

    - No way to optionally make the network transparent like ROSE or IP. Connecting to Netrom node A, thru to Netrom node B, then out to user node C gets kind of tedious. A connect scheme that uses the digipeater fields (like ROSE does) would be nice.

    - Dumb, fixed timing values

    - Routing news travels too slowly. "Good news" (e.g. new nodes) travels throughout the network rapidly, but "bad news" (e.g. nodes that can no longer be reached) takes a while to make its way around.

So, for those of you that have worked with the various Network/Transport protocols (TexNet, ROSE, and TCP/IP), how do you think Net/Rom stacks against the rest?

>me, and I'll summarize. Tnx & 73s...

Mark,

What you probably heard about was the very early origins of my code, which indeed ran on a CP/M machine. A Xerox 820, to be exact. I threw it together in late 1985, mainly in response to a challenge by WB4JFI who had been loudly claiming that TCP was far too complicated to ever be implemented on a machine that hams could afford. I had it going in time for a Telnet and FTP demo in early 1986 at the ARRL Computer Networking Conference in Orlando.

Although the TCP/IP code itself had no trouble fitting (it's actually smaller than the AX.25 code, for those who like to argue about whose protocol is more gratuitously complex) the rest of the package (servers, clients, buffer management, kernel, session control, device drivers, ax25, etc) quickly outgrew the limited memory available on the 820. When I got a PC the following year I moved the code to the PC platform where it has remained since. Not only is there 10x as much total memory available, but the same C code typically compiles into half as much code space on the PC's 8088 as it did on the 820's Z-80.

So the short answer is that yes, somewhere around here on 8" disk I have the very early version of my code during its short stay on the 820, but no, you don't want it. Go buy a PC; XT clones are now dirt cheap, and CP/M is just not worth the hassle.

Phil

This is correct. One port is designed for HF operation, and the second port
for VHF.

 >I'd like to have some of the other features of KAM, but I want dual ports
 >that will both be concurrently operating on VHF.
 >
 >Does anyone have these radios and can explain what they REALLY do as

 >to what the "slick ads" and "glossy brochures" imply?

I have the KAM and would be glad to answer any specific questions you have via
mail. From my understanding both the KAM and KPC4 are dual port TNCs, however
the KAM can only operate HF <-> VHF operation, while the KPC4 is designed for
VHF(UHF) <-> VHF (UHF) operation.

I have recently installed the KA9Q tcp/ip package on my system. In the mailbox mode is on, it appears that the mbox can receive mail (including bulletins) from a RLI style message forwarding system.

Is the tcp/ip only designed for receiving, or is there a way for it to send mail to RLI style system for full bidirecitonal mail forwarding?

I have a venerable Tempo S-1 (the one with the speaker/
mic connector) that I think would be happy being moved
into stationary operation as a dedicated packet radio.

Has anybody out there tried this? Is there anything I need to
know? The mic connection is a bit strange, do I need to do
anything besides put a capacitor between the TNC and the mic
input?

Thanks for your help, Denis Lynch, N2TI

The reference made to the the boring nature of ROSE X.25 and IP networks
is absurd! Come on already, do we really need to have almost manual
networking to interest folks? I don't think so. In fact our users are
thrilled that they don't need to patch connections together like Net/Rom
NETWORKS regularly require. Fact 1: A Net/Rom user must connect to an
access switch, then call to the terminating (or intermediate) switch,
then call the user with whom a dialogue is desired. Three steps!
If the network gets chopped up then the user must place calls between
sites in order to get the connection built! This means four or more
steps!...uuuugh! Conclusion: Net/Rom is, from a user perspective
similar to calling Mabel and asking her to place a call to your
cousin in Tombstone.
Fact 2: ROSE X.25 Network users place one call to their party via
and access switch and egress address. ONE STEP. Boring maybe, but
it works real well for the users. (REMEMBER THEM?)
Conclusion: When two systems work well choose the simpler one even
if it is "boring".

One other point Net/Rom networks often get trashed by dumb users
who route their own calls (uuugh!). This can take several forms
including routing loops, poor trunks etc. The ROSE X.25 Switch
doesn't let that happen. It clears call loops and tries the next path.
It also chooses routes that have been tested and are known to work
well, no dynamic path roulette with user calls.

The ROSE X.25 Switch runs in a TNC-2 (or clone) and a PAC-COMM DR-200.
Soon it will run in MS-DOS and similar machines.
If you would like the software, then contact me via telephone.

The air seems to be full recently with comments reflecting on the limitations

of packet radio. Perhaps it is time to broach a subject about which I have been stewing for some time ... but have kept patient silence.

Computer Science people may remember a suggestion by Brooks {of Brooks' Law fame*} that in any computer project you should "Plan to throw one away." That is: when you finally finish a large computer project you will have found out lots of errors you made in your early design assumptions which you can't take out without completely redoing it. The thing to do to get it right is to immediatly get rid of the first system and then design its replacement using the experience of the first as a prototype to correct the second.

Compare OS-MVS on the 370 archetecture with VMS on the VAX and you have an idea what that means. IBM kept ALL the old stuff and built on it, DEC threw away the errors and kept only the good stuff. Perhaps that it why IBM is now worried about loosing market share to DEC. -- Other examples are left as an exercise to the reader.

Packet Radio is built using some wrong assumptions. They weren't wrong when TAPR and the other pioneers started work, but have been made wrong by the very popularity of packet radio. The success of packet has made the early assumptions wrong. Now that packet is prooven and experience is here, it is time to throw the old design away and start over.

The TAPR design assumes that:
 1) HAM operators would be communicating interactively with each other via dumb terminals -- human to human.
 2) Voice radios would be adequate for digital communications.
 3) The X.25 and HDLC protocols widely used in wire communications would also be efficient when used on radio.

Actual communications is usually either electronic messaging (human to machine on BBSes but more efficient machine to machine), and data transfer (machine to machine). Store and forward would be much more effective that end-to-end packets for machine to machine work.

Voice radios are too narrow band and much too slow in "Clear to send" time to do effective data comm. ("I'm going to forget about packet until 1200 baud half-duplex is a memory.")

One shot error-detect-and-retry protocol to single addressees is not an effective use of a broadcast media. The media calls for error CORRECTING redundancy codes and multi-address communications. I should be able to do a QST or club meeting by packet.

If I want to send an announcement to all the members of my {whatever} club, why should it be transmitted 31 times; once to the BBS and then read by each of 30 members over the air? My station should broadcast it ONCE. If any receiving stations get errors, its computer should fix it, or flag it. If Joe, across town, can't make sence out of his copy (remember, Joe can read CW with one third of the characters missing) his computer can ask mine (or, perhaps the clubs) for a clean copy.

Perhaps we should even use a dreaded UNbalanced protocol, where the central

(BBS - net control) station has more "authority" than the end nodes.

I think it's time for a new plan, based on computer-to-computer communication
using radios designed from the antenna down to do nothing but digial
communication. I want to receive this newletter on my radio.

What think ye?

ka9q>So the short answer is that yes, somewhere around here on 8" disk I have
ka9q>the very early version of my code during its short stay on the 820, but
ka9q>no, you don't want it. Go buy a PC; XT clones are now dirt cheap, and
ka9q>CP/M is just not worth the hassle.

Well, dirt-cheap XT clones aren't portable. Expenseive portables still
draw gobs of power. I intend to port the stuff to my Cambridge Systems
Z88 -- 20 hours on 4AA batteries, and I'm already using it as a packet
terminal. The whole setup (terminal, tnc, 2m HT, and gelcell for the
TNC) ts in a small briefcase, or backpack -- I got at least three more
of my hacker friends interested in packet (and ham radio) when they
saw it. The Z88 has 128K of RAM (and can go to >1Meg) and a 3.5Mhz
Z80, plus some smart IO hardware, so it is a little bit upscale of a
CP/M system.

So, does anyone have a copy of the early stuff, or should I just go
ahead and port the C stuff by hand? (I've already got a few requests
to forward the stuff in any case...)

>Well, dirt-cheap XT clones aren't portable.

I've run TCP/IP out of my car several times for demos using a NEC multispeed laptop and a TNC-2 that I plug into the Icom mobile rig. (It was fun to look up the callsigns of the bystanders at our Field Day site in the callbook database on the system at home).

Others frequently run my code on cheaper machines like Toshiba 1000s. But if you really want to run TCP/IP on cheap portable hardware, then my recommendation is to start with my current code and try to port portions of it to your hardware. Quite a few bug fixes have been applied to the code that originally ran on the 820 four years ago.

(First, a disclaimer on my part. I have never used ROSE. I have the source to beta version of ROSE that I have looked at briefly. I have used Net/Rom and have looked at W9NK's implementation in the KA9Q package).

*** Gordon Beattie, N2DSY writes:
>The reference made to the the boring nature of ROSE X.25 and IP networks
>is absurd! Come on already, do we really need to have almost manual
>networking to interest folks? I don't think so. In fact our users are

I personally am more interested in how the network works than actually using the network. This interest is analogous to those who are interested in ham radio for the "art" of radio (couldn't think of a better word :-) instead of just for ragchewing. Given these interests, a totally transparent network is a little less interesting to me than one in which I can get my hands on the internals.

>thrilled that they don't need to patch connections together like Net/Rom
>NETWORKS regularly require. Fact 1: A Net/Rom user must connect to an
>access switch, then call to the terminating (or intermediate) switch,
>then call the user with whom a dialogue is desired. Three steps!

I know that this procedure is a little tedious. I put this problem on my "disadvantages" list of things to be improved: I proposed adding a scheme to Net/Rom similiar to the scheme used in ROSE: it wouldn't be that hard.

>If the network gets chopped up then the user must place calls between
>sites in order to get the connection built! This means four or more
>steps!...uuuugh! Conclusion: Net/Rom is, from a user perspective
>similar to calling Mabel and asking her to place a call to your
>cousin in Tombstone.

One advantage of this scheme is that the user immediately knows where of three places his connect attempt failed: from his home station to the network entry point, through the network, or from the exit point to his destination station.

>Fact 2: ROSE X.25 Network users place one call to their party via
>and access switch and egress address. ONE STEP. Boring maybe, but

I like this feature. What kind of call progress messages does ROSE generate? In other words, will ROSE tell me where a failed call failed?

>it works real well for the users. (REMEMBER THEM?)
>Conclusion: When two systems work well choose the simpler one even
>if it is "boring".

>One other point Net/Rom networks often get trashed by dumb users
                                                    ^^^^ ^^^^^

    This I take a slight offense to -------------------^^^^
    and I'll try to explain why.

     I consider myself a "user", but far from a dumb one. And no network is so smart as to be able to find the best path all of the time. I *like* having escape hatches where I can sieze some control over what's going on. Net/Rom allows me to do this. What features does ROSE have for manually routing calls?

>who route their own calls (uuugh!). This can take several forms
>including routing loops, poor trunks etc. The ROSE X.25 Switch
>doesn't let that happen. It clears call loops and tries the next path.
>It also chooses routes that have been tested and are known to work
>well, no dynamic path roulette with user calls.

     Net/Rom is pretty dumb sometimes when it comes to routing. I'll have to take a closer look at how ROSE does routing.

>The ROSE X.25 Switch runs in a TNC-2 (or clone) and a PAC-COMM DR-200.

     This is a good feature. It is still cheaper to put 2 or 3 TNC 2 clones on a mountaintop than some cheap PC/XT box. The TNC 2's become even more attractive if you want to battery back-up the sytem. Where are you PS-186???

>Soon it will run in MS-DOS and similar machines.

     This is good too. I'm curious, is the MS-DOS implementation intended for end users, or for network switches?

***
     I guess what it comes down to is that I like to drive a stick shift car instead of an automatic. I like having some control, instead of being at the mercy of the network. I said that completely transparent networks are "boring" for the same reason I find driving an automatic "boring" -- lack of control.
     I like Net/Rom because it gives me some control. I can see the uplinks to a distant node and say: "Ah, 3 users at 1200 baud, that's why things are slow!" Or, I can probe around the network and find routes that are up or down, etc. Or I can test a remote node's connectivity _into_ some area.

     Now that you ROSE users know where I'm coming from, what features does ROSE have to accomodate a user like me? In the meantime, I'll have to dig out my ROSE sources and study them in a little more detail. I'd like to see a network that has the good features of both Net/Rom and ROSE, yet still runs on a TNC 2 box (since there are so many of them around).

As usual, comments?

For perhaps the first time on this forum, I agree fully with Gordon Beattie. The notion that a packet network that *requires* the users to do manual routing is somehow superior to an automatically routed network is ludicrous!

I don't think the people who operate the ARPA Internet and do networking research with it consider it "boring" that the Internet provides automatic routing. Nor do its users. Of all the networking packages available for amateur packet radio, mine is the only one I know of where it is standard practice for the end users and applications to specify ONLY the ultimate destination of a network request when opening an end-to-end connection or sending a datagram. This goes well beyond NET/ROM and ROSE in that you don't even need to specify the entry and exit points of the "backbone" network; the connection is truly end-to-end. (To be fair, the NET/ROM and ROSE protocols COULD both be used in a true end-to-end mode analogous to TCP/IP. But at present, the only package that supports the NET/ROM protocols in this mode is mine, thanks to W9NK's contribution, and I do not believe that RATS has yet produced an end-host implementation of ROSE -- Gordon, correct me if I'm wrong.)

Even though they don't have to specify a route each time they establish a connection, it is true that most users of my code have to configure their local routing tables manually when they come up on the air for the first time. I certainly don't consider this a feature. I consciously decided to defer *fully* automatic routing because I knew that the job was a difficult

one. (Just *how* difficult, I'm only learning now!) Most of the TCP/IP users are at fixed locations, so statically maintained tables do not need to be updated frequently. Nevertheless, fully automatic routing is definitely in the works thanks to several contributors to the project. (The current NOS code does support BSD-style RIP, but I do not recommend its use over radio for anything except small-scale experimentation).

With or without automatic routing table maintenance, the Internet Protocol (IP) provides facilities for source routing (the user picks the route), although they are very seldom used. My code supports source routing at the IP layer, although there is at present no way for the end user to actually specify a route. (There just hasn't been any demand for it.) The Internet Control Message Protocol (ICMP) is used to notify users of the Internet when packets cannot be delivered for any of a number of reasons, including routing problems; you can have my package display these if you want. There are some clever tricks you can play with IP and ICMP to determine the route the network is taking to reach a given destination; they are used in the "traceoute" package that is popular in the Internet. I haven't yet implemented such a feature in my code, but I've been thinking about it.

So there are still plenty of "hooks" in the Internet to play with if you want to see what's going on. These facilities all fall in the rather nebulously defined area of "network management", which is a pretty hot topic right now.

Phil

It occurred to me after sending my last message that a discussion of routing related terms might be useful in explaining just what the features are of various networks, since I often find that people are confused easily by terms like "static routing" and "incremental routing".

1. Source Routing vs Incremental Iouting

Source routing - the originator of a packet specifies the entire route it is to take through the network. The major advantage of source routing is that a knowledgeable user can take manual control and bypass a broken automatic routing mechanism. Another advantage is that unintentional routing loops are impossible. AX.25 digipeater paths are the obvious example in the amateur world, although those who use UUCP are also familiar with the "bang paths" used there. The Internet supports it as a rarely-used option, and IBM has proposed a bridging technique for token-passing ring LANs that uses source routing. Note that HOW the end system puts the route into the packet is not specified; the user at the keyboard might have to specify it manually, or it might be kept in a local database and invoked automatically when the user specifies just the destination. (My code allows both forms of operation in the AX.25 layer.)

Incremental routing - the opposite of source routing. Each node need know only the next node to which a given packet or message should be sent to take it closer towards its destination; where it goes once it reaches the next node is the decision of that next node. The main advantages of incremental routing: smaller routing tables in each node and less packet overhead since no source route must be carried. This is by far the most popular approach taken in modern packet networks; it's used by default in IP (though source routing is available as an option), it's used inside a NET/ROM backbone, and I believe it's used in ROSE. Note that even though a NET/ROM network uses incremental routing internally, the AX.25 end user is still required to *partially* source route his traffic by specifying the entry and exit points to and from the NET/ROM backbone. This can be avoided if the end users run the NET/ROM protocol stack on their own machines.

2. Static Routing vs Dynamic Routing

Static routing - the node routing tables used in either a source routed or incrementally routed network are maintained manually. Advantage: simple and stable; requires no network overhead. If done properly, routing loops are easily avoided. Disadvantage: requires manual reconfiguration whenever the network topology changes. ROSE and (most) amateur TCP/IP stations are currently using static routing.

Dynamic routing - the opposite of static routing. The routing tables in the nodes are maintained automatically by real-time information received about the nodes and links in the network. Advantages: automatic adaptation to link and node failures, automatic incorporation of new nodes and links into the network, ability to reroute traffic automatically in event of congestion in parts of the network. Disadvantages: can be difficult to implement, requires network bandwidth for passing routing information (can be considerable if the protocols are not properly designed or tuned, e.g., RIP.) The (real) TCP/IP internet uses dynamic routing, as does NET/ROM and virtually every large packet network. (Virtual circuit based networks that use dynamic routing generally fix the path taken by a call once it is established; it is subsequent calls that may take different paths to a given destination. Datagram networks can dynamically route on a per-packet basis.)

2.1. Centralized dynamic routing vs distributed dynamic routing

There are two major categories of dynamic routing algorithms: centralized and distributed. In centralized routing, the network status information is funneled to a central point where routes are calculated for each node in the network and fed out to the various nodes. In distributed routing, there is no central node; the nodes exchange information among themselves and they each compute their own routing tables on the basis of this information. The main advantage of centralized routing is that coordinated, network-wide policies and strategies can be implemented more easily, but in general the severe vulnerability of the centralized approach to failures (particularly of the central node) has made the distributed approach more attractive even though it is harder to implement properly.

The TYMNET X.25 network and IBM networks are among the only networks I know of that rely heavily on centralized routing; the rest (the telephone network, Telenet, the Internet, NET/ROM) are all distributed. I think it's safe to say that distributed routing is clearly the way to go in the amateur world.

2.2.1 Distance vector distributed routing vs link state distributed routing

Moving down a level, there are two major categories of distributed routing algorithms: distance vector and link state. In distance vector routing, the neighbors periodically exchange their routing tables with each other, often by broadcasting them on a common channel (radio, Ethernet). Each entry in the table specifies a destination and the "distance" (cost, number of hops, etc) to that destination, hence the name "distance vector". Each node receiving a routing broadcast compares the distances advertised by its neighbor to those already in its own table. If a neighbor's route to a given destination is better, it is incorporated into the node's routing table and passed on in its own routing broadcasts. The major advantage of the distance vector technique is simplicity and minimum memory requirements, but a major disadvantage is slow adaptation to change (especially link failures) and a strong tendency to form routing loops just after link failures have occurred. Enhancements to the algorithm that reduce the frequency of routing loops do exist, but they sometimes cause outright outages between given pairs of points when things are rapidly changing in between. RIP (the de-facto Ethernet routing protocol) and NET/ROM routing are examples of distance vector routing. Cisco Systems uses a proprietary distance vector algorithm called IGRP.

The other type of distributed routing is the link state algorithm. In this technique, each node issues information only about the state of its own links. This information is propagated throughout the entire network using a "flooding" technique very similar in concept to that used in USENET. Every node keeps copies of the link state updates from every other node in the network, and from this "link state database" each node can compute the optimum route to every other destination. The main advantage of this method over the distance vector approach is much quicker adaptation to failures and reconfigurations with much lower susceptibility to routing loops. The main disadvantage is the more complex implementation, plus the extra memory required to hold the link state database. Nevertheless, this method is

rapidly displacing the distance vector approach. Link state routing is used internally in the ARPANET and MILNET, and in the new NSFNet that now forms the backbone of the US Internet. The Internet community has just proposed a link state algorithm that is intend to replace RIP. Several people are now working on link state implementations for amateur TCP/IP as well.

3. Flat vs Hierarchical addressing

Flat addressing - the address of a node in the network has no relation to its topological location. This generally requires an individual entry in the routing table of every node in the network for every other node. Advantages: can support arbitrary topologies. Node addresses need not change when they are moved. Disadvantages: large routing tables (total memory needed by all the nodes goes up as the number of nodes squared). Network overhead for routing updates also goes up rapidly with increasing network size. Flat addressing is used by NET/ROM and bridged Ethernet networks.

Hierarchical addressing - the address of a node gives at least a partial hint as to the nodes location. Advantages: Nodes far away from a given area can use a single routing table entry to refer to all the nodes in that distant area, greatly reducing the rate at which routing tables and network overhead increases as the network grows. Virtually all large networks use hierarchical addressing in various forms, including the telephone network, the postal system, the Internet, the commercial X.25 networks and ROSE.

My own code allows the network designer to use a mixture of flat and hierarchical addressing as he sees fit.

I hope this summary of the various pros and cons has helped people understand the issues involved.

You are not alone. I like transparent networks, but my personal interest is
more into designing things for them.

>   I know that this procedure is a little tedious. I put this problem
> on my "disadvantages" list of things to be improved: I proposed adding a
> scheme to Net/Rom similiar to the scheme used in ROSE: it wouldn't be that
> hard.

The hard part is getting it to do it with. If I had (been so nieve as to have)
written Net/ROM as it is now, I'd very easily be able to add this feature.

> >If the network gets chopped up then the user must place calls between

> destination station.

Facilities can be built in to report this. Of course reporting it will be
in the context of the route and no longer be transparent. One might want to
know where their connections get routed through anyway.

>   This is a good feature. It is still cheaper to put 2 or 3 TNC 2
> clones on a mountaintop than some cheap PC/XT box. The TNC 2's become even

> PS-186???

One of the reason's I'd like to be able to program code to go into a TNC box,
but so far I've not had much luck in getting specifications of the internal
environment such programs have to work in (e.g. what address is the serial
port, etc).

How about one who designs automatic transmission for a living, but only
drives a stick? You know when to shift into 4th, you can make a machine
do it, but you don't care to actually have the machine do it for you (all
the time anyway).

>   I like Net/Rom because it gives me some control. I can see the

> some area.

I, too, would like control, but at an even lower level than Net/Rom gives
me (and not vanilla AX.25 either). I want bit banging control.

This is not a criticism against Net/Rom, but it is obvious the author had
some info I can't seem to get, and he doesn't seem to want to part with
some things I'd like to have, like Net/Rom sources so I can try hacking
in some improvements. I'd rather smooth out round tires instead of trying
to cut squares one, if you know what I mean.

    I don't know where this notion came from, but I hope I explained
myself clearly in my earlier post. I just like having options....

>I don't think the people who operate the ARPA Internet and do networking
>research with it consider it "boring" that the Internet provides automatic
>routing. Nor do its users. Of all the networking packages available for

    I use the Internet and DEC's internal network daily and I don't
find it boring at all. I do find it "boring" when something doesn't work
("node not responding", or "connect failed") and there is no way for me
to find out more (I love to tinker with these things!)

[... stuff deleted ...]

>So there are still plenty of "hooks" in the Internet to play with if you
>want to see what's going on. These facilities all fall in the rather
>nebulously defined area of "network management", which is a pretty hot topic
>right now.

Yep, I've been wanting to play with some of the "hooks" in IP for a while now, but haven't been able to on the ARPA Internet because I've always lacked the privs. I've gotta dig my Mac out of storage and get on TCP/IP using it as a dedicated box....

Phil, I think you hit the nail on the head by saying that "network management ... is a pretty hot topic". Things are still so very young, and my top two things I'm currently looking for in a network are:

1) Transparency
2) Optional hooks to make it untransparent

(For me, #2 is really close behind #1)

Also, thanks Phil for your summary of the various routing issues -- I'm saving that one.

Well, enough of my ramblings for now. As usual, comments appreciated.

>time to throw the old design away and start over.

Actually, that's pretty much what the TCPers are doing... so we're in
agreement so far.

>The TAPR design assumes that:... (omitted for brevity)

Yes, your observation is valid. There are reasons for supporting dumb
terminals (including PC emulation) and voice radios (available!) but
they shouldn't be the design center.

>One shot error-detect-and-retry protocol to single addressees is not an

>town, can't make sence out of his copy (remember, Joe can read CW with one
>third of the characters missing) his computer can ask mine (or, perhaps the
>clubs) for a clean copy.

True, but not trivial. You might want to check the hack I came up with
in RSPF, which does this for its routing updates. Each route
advertisement is multicast, with each segment (=packet, in a
multi-packet message) numbered. At the end, recipients know what they
have and what they don't. I haven't put too too much thought into
selective retransmission yet (since RSPF repeats the cycle often enough
and allows some polling), but it's not that tough, or easy, a problem.
Bulk-transfer protocols like NETBLT overlap the issue.

>Perhaps we should even use a dreaded UNbalanced protocol, where the central
>(BBS - net control) station has more "authority" than the end nodes.

At the applications layer, yes, but that already occurs. I hesitate to
apply this to a lower layer; it tends to make networks vulnerable when
the transmission is as crufty as packet radio's. I observe, though,
that "packet cluster" software used by DXers is just as wasteful as
anything, and might be a good place to start.

>I think it's time for a new plan, based on computer-to-computer communication

>
>What think ye?

Waddayathink Phil and the rest of the TCP/IP crowd has been doing all
these years? Join in!

BTW I'm NOT saying that TCP/IP is the be-all and end all, just that the
TCPers are an example of hams who aren't following the TAPR/AX.25 model.

I have a personal notion of an OSI-IP ham network, f'rinstance... and
we could use some work on multicasting as per your observation. 73,
    fred

Hello packeteers!

I can only agree with the question mentioned above, though I'm afraid that
in our country many people aren't interested in the functionality I (and
according to me others as well) are interested in. Remember that not
everybody has all these fancy machines with lots of memory and a big fat
harddisk :)), there still are people working with CPM and Commodore 64's etc.
But actually what I want is the Internet system at home, on my computer (in
my case a Macintosh) embedded in its functionality!
So in my case I want to go to the chooser, click on the packet icon and choose
(or type) the station I want to be connected with... Or even a fileserver
on my desktop. I think it can be done with TCP/IP, but then we should
transmit the data-frames directly on the air without the overhead of AX.25
and of course much higher baud-rates...
This is naturally not in accordance with the experimental character of our
hobby, but as long as it isn't there...
I also heard some people complaining about the "boring" character of an
implementation like this, but one can write occasional software to monitor
the network and make additions to your routing tables.
Well all this dreaming is very high-level of course and I would like to dig
in deeper, but I just started networking subjects for my studies so that will
have to wait a while :))
Please, any comments are welcome!!

Annard.

P.S. Phil, is it possible to use the MacTCP package in your internet package?

First my apologies to hams that are not into packet for this posting. My

feed from "info-packet" has been irregular or nonexistent lately.

Can anyone with an "in" with TAPR (Phil // Brian?) give us the latest scoop on the TAPR packetRADIO project? I realize that this is a topic for presentation at the Colorado Conference, but I was hoping for some advance info.

Rumor control has it that some of the units are now out in Beta test, and while I filled out the little form volunteering for that effort, I never received a reply. To get in a little plug... the whole state of North Carolina is VERY interested in acting as a Beta Test site for that project (and yes I am authorized to speak for the state :-)

I have seen the recent flyers from Kantronics advertising the 2 watt 9600 baud unit and also some blurbs from Paccom also hyping their product. The big draw on the TAPR unit is its proposed turn-around time and its higher power output of 25 watts. Does anyone have any idea whether these units are going to be compatible with each other and to what degree?

While I realize that using a TNC as a switch is now considered to be a rather primitive concept and that there are many better ways to go about it (and some rather astounding products are "in the mill"), this TAPR packetRADIO is EXACTLY what we are looking for in our stage of development and I honestly feel that we represent the feelings of a lot of others that are in the same situation.

Sooo... Any word on when this unit will be available, and at what cost, or answers to any one of the other questions?

Thanks in advance.....

Mark Bitterlich

Go pound sand. This is the kind of attitude that made America great?

No, it's the kind of non-productive attitude that made America what it is
today - the land that's second-rate in technical ability and first-rate
in lawsuits. I think that people like this could best benefit the
public good by suicide.

Lead, follow, or get the hell out of the way.

Actually, I sympathize with the original author (Dan?). If you actually
try to USE the packet networks in many areas, you'll quickly find that
quilting or worm-farming is more rewarding.

I stay moderately active, both here (playing protocol weenie) and on the
air (reading rbbss, etc.), but I could never get a true computer weenie
interested in packet radio if he saw what we now run. Sure it's not
adequate to sit back and let George do it, but "mainstream" ham packet
is content to let the digipeaters and net/romms be "George". It's swell
compared to '50s-style RTTY, but it's no comparison with modern wireline
hacker datacomms.

I take Dan's message as being a warning, not as a copout.

>>Well, dirt-cheap XT clones aren't portable.
>

I might suggest something else. Take a look at the Ampro LittleBoards. These little boards, which mount on the side of a disk drive, are self-contained including serial ports and video adaptors. They have a 286 version that will give you an AT in a box.

In other words, you can strip out the Z-80 cpu board, bolt in an Ampro board, and have a modern system and use your existing periphials. I have built machines in this format and can say that it works fine.

I can understand your loyality to Z-80 machines. I have a closet full of them. The problem is that the hardware has long since quit being the driving factor. Software development tools now drive hardware selection decision. I have looked at practically every C development system available for Z-80's (native and cross), and have yet to find one that comes anywhere near either Microsoft or Turbo C. I would LOVE to find a good C development environment for the Z-80. I know the chip well, have a nice hardware development environment and a lot of experience in both hardware and software. I find that I still have to limit myself to Z-80 projects that I can do in assembler.

We have looked at porting portions of Phil's code to the Z-80 environment for the purpose of putting a Telent client into a ROM for the TNC-2. This would allow keyboard users to take advantage of IP networks. We've pretty much decided that it just won't fit, given the quality of C compilers.

Why not spend a little money and get a system that supports modern tools.

John

>"We have the technology"... what we don't have is a large enough group of
>committed folks to make it really happen...

   I want to clarify my statement on this. As Bdale mentioned, I have
some heavy demands on my time, between a new daughter and a new business
(I'm not sure which is worse!), but the main reason I am out of packet
is that it stopped being any fun. I found myself babysitting not only
the local IP traffic but also the Wisconsin/Michigan NET/ROM network,
spending hours in trace mode every night watching TCP connections retry
again and again because the physical layer wasn't up to handling a
tenth of the traffic on the network. I walked away from my computer
angry almost all the time. It's only a hobby, and when it stops being

fun I'm going to stop doing it.

Before I gave it up, I got together all the local "leading lights" in packet (i.e. the TCP/IP users) and explained that I could no longer fill in with software a network that needed new and better hardware. I asked if people were willing to get some DSY modems and do some experimenting, and maybe look at building a repeater or translator. The answer every one of them gave was, "I am not willing to spend $300 on a 56K modem when I can run packet with a $100 TNC." I could not find *one* person in this area willing to buy and build a DSY modem so there would be a pair locally (I was going to build the other, obviously).

If and when someone around here decides that they want to do something with the physical layer, and that they are willing to invest more than a hundred bucks and ten minutes, I might get back into packet. I'm not saying, "I'll sit back and let folks build the network for me." I *am* saying, "I can't do it all alone. Call me when *someone* is interested in building the network *with* me." Until then, I have a business and a family to build.

TEMPO S1 SIX PIN CONNECTOR INFORMATION

A long time ago, I used to have the manual and this is the original source of this material. I have long since lost it (and am still looking for a copy :) as well as any info on how to power the Tempo S1 with any other power supply besides the batteries. Any info on the batteries/alternative power supply or manual appreciated at this end!!

I've been using my TEMPO S1 for over a year on PACKET. Below is a picture as best I can represent the TEMPO S1 top panel and the six pin connector. The earlier models did not have this six pin connector

(I have no idea of how to hook them up for PACKET, sorry). My model also has an EAR jack on the left side above the PTT button, but I have never used it though. The male connectors for the six pin plug are still available from HENRY RADIO. I'm not sure on the price. Get a small soldering iron for this connector!!!! They also sell other accessories such as a convertor to go from the screw in type jack for the rubber duckie to a PL-259 (or is it SO-239, I'm not sure). And a battery charger that goes to the cigarette lighter of your car, etc.

Parts are available from :
Henry Radio

I hear alot about the mailbox feature being added to TNC2s with 32k ram.
Is the new software available somewhere for FTP?

Running into same problem with message queues under Xenix 286 system,
but same configurations on different boxes produces different results.
One system will run ONCE, but then have to reset and reload operating
system to get it to come up once exited. Other will not function at
all. Both develope problems in msgget calls within ax_mbx.c.

Anyway, now to figure out how to hook my bbs software into net...

Now in the works is a cartridge version of Digicom64, the TNC emulator program
for the C64/128 (see my article in August '88, 73 Magazine for info).
The cartridge is autobooting and permits parameters to be stored to the
cartridge, eliminating the need for the disk drive, for those of you without
a drive. This also makes it ideal for hilltop digipeating with a minimum of
equipment. Further info to follow as it becomes available. 73/Barry, W2UP

While reading articles on cellular radio (the ones about how the cell site controls the phone's output power) and the combination TNC and radio (if I understood it right!), I had this idea: Maybe the packetRADIOs can automatically adjust each other's power to a level low enough to maintain reliable communications and to avoid tying up the frequency in areas far away from each radio in the QSO. This could be done just after the connection is made, the radios having measured each other's full power signal strength. the next transmissions could be a verification test, to see if the adjustments are reasonable. After that, then the real communicating could start.
  If all radios in the area and freq do this, maybe on average, more stations could use the channel.
Anyway, just an idea.

It's a shame that a hobby can get spoilt this way. I rapidly got fed up
with the congestion on the 'BBS channels' here and moved onto tcp/ip
which is pretty sparse in my area.

I thought that in the UK we were behind you guys in the packet area
and that all these high speed links were the norm. It would appear not.
There is a group of us here around London who are about to upgrade to at
least 9600 baud. The plan is to hit 56KB and higher in the near future,
and to place a high-speed backbone around London.

If you ever feel like moving to London, we'll help you out :-)

Seriously though, if you have had any thoughts for improvements that may
help build our network, I'd love to hear them. NET around here doesn't
look the same these days anyway.

I'm using the TNC-1 KISS code for my ancient, but reliable TNC-1. The
problem I have is that I can't seem to get the ROM bits to operate but the
RAM-based version (downloaded to the tnc via the TNCBUG monitor) works fine.

The main problem I see is that the ROM KISS will monitor the channel OK,

send packets OK, but fails to receive the first packet heard immediately after sending one. This is rather frustrating, since the first packet heard after sending one is usually some sort of acknowledgement of the just-sent packet! (And no one tell me to use a more congested channel!)

I've diddled with the various timing parameters, thinking that perhaps one of those is not set correctly, but to no avail. Has anyone one else solved this problem? I really rather not have to dig out the old 6809 analyzer and re-debug the wheel.

I didn't pay attention to the cost before. I personally provide TAPR with copies of the latest releases, and they make PC floppies available. The full four-disk set (two with executables, config files, and docs, two with sources) is $8 last time I checked, they charge a flat $2/disk to mail things out. They also have a wide variety of other packet software available for the PC under the same terms, contact the office for more information. They do not currently have the facilities to handle media other than 360k PC floppies, so coordination of distribution for other platforms still makes sense.

 My packet operation is bothered by something I understand is common,
I run a dual band radio (IC-3200A) and have used anything from a TNC-1 to a
KAM quite sucessfully, but every time I try to connect with a person that
is local to me, that is one that doesn't need digipeating, I have fits
getting and keeping the connection. I believe that it is the radio's T-R
switching in that it doesn't get back into receive fast enough to hear
the return packet. It seems to me if this was a common problem everyone

would set their TXDELAY to something longer (at the risk of slightly more channel usage) so people like me would have an easier time of it.

As it is, to do a simple loop back test, I need to venture out 2 nodes to get back...

I've heard of this problem mostly using dual band radios, another being a FT-727. Is this mostly a problem with dual band radios? Why don't people tweek up their TXDELAY? Why don't TNC manufacturers make defaults a little larger in the TXDELAY parameter?

Has anyone else seen this or solved the problem by getting most people in a given area up their TXDELAY?

The Radio Amateur Telecommunications Society

The Radio Amateur Telecommunications Society (RATS) and the New Jersey Institute of Technology Amateur Radio Club (NJIT ARC) are co-sponsoring the first

RATS Open System Environment Symposium (ROSES-1).

ROSES-1 is a packet forum for new users, PBBS sysops and network gurus focused on OSI or Open Systems.

There will be tech talks and roundtable discussions on many areas of packet operation as well as:

+ LICENSE EXAMS provided by the Bergen Amateur Radio Association from 8AM until 11AM.

+ Equipment and demonstrations will be conducted and literature will be available.

+ TNC tune-up clinic so bring your radio and TNC.

The date is November 11th from 8AM until 6PM in the Hazell Center on the NJIT campus in Newark, NJ. Admission and parking are free for all attending.

Talk-in will be on 145.19 (-600).

For testing information contact Pete Adely, K2MHP at 201-796-6622.

For more information including speaker requests contact Gordon Beattie, N2DSY at 201-387-8896 or via packet n2dsy@kd6th.

I can tell you how to do it if the software isn't properly operating. I've never seen it done on any active systems, but I found a way to do it on my own software while it was under developement about a year ago. It's similar to the old ancient "hackers" trick to get a phone modem off the line, thereby crashing a BBS system. Most software won't allow that to happen, since it's

such an easy thing to code around. That's why most current systems use hardware handshaking now-a-days. Does the software in question possible try to keep the TNC in CONVERSE mode with software handshaking?

Walt

I saw a recent posting (don't remember if it was here or INFO-HAMS) about a program called ARES/Data to track emergency services activities and people. The posting mentioned a Compuserve address where this program was available.

Has anyone posted this software elsewhere, like Simtel20, or could someone do so where it would be available to those of us who do not have access to Compuserve?

In case this has already been done, could someone please E-mail me the address/filename?

Thank you very much.

73,
Michael

I also have the IC-3200A. The receiver recovery time with that radio
is overly long. The fix is simple: open up the rig and remove diode
D19 in the audio output stage. This diode biases the output stage off
during transmit, but it is unnecessary because there are other audio
gates ahead of this stage.

To: all\@allbbs $1609_N2DSY
Fr: J. Gordon Beattie, Jr. N2DSY
Sb: Distribution + Hierarchical Routing Names

I am collecting information for a Amateur Radio directory service. The items I am looking for are outlined below, but in short, please send me the distribution group names and the hierarchical routing names used in your area.

The results will be posted in all the usual places with the intention that it will reduce conflicts and help the packet community evaluate what enhancements are needed to handle future growth. It will also provide a few references for folks wishing to add new names to the list.

I. DISTRIBUTION GROUP NAMES
   Please send in the distribution list names used in your area to distribute bulletins, group messages etc.

Examples of these include:

"all\@allbbs", "rats", "all\@nynet", etc.

This includes private lists such as "ratsmbr" (rats members). In the case of distribution group names please include the current distribution and if there are limitations on who may use this list when addressing a message.

II. HIERARCHICAL ROUTING
    Please send in the hierarchical routing entries used in rfc822-like domain strings found in messages. These usually include a "#" at some point in the string.

III. WHAT TO SEND IN?

Please send the following information with the entry:

1. Entry

2. Region or group using the entry

3. Responsible individual/club/net

(include contact information, if known)

3. Systems supporting it
(if known)

4. An example of how this is used
(Command lines, sample messages into and out of the
system performing distribution would be helpful.)

5. The format of the BID associated with the distribution name.
(e.g. is there a special character sequence used with the
messages, or is the numeric sequential or a date, etc.)

6. Message type(s) used in conjunction with the group name,
hierarchical routing designator, etc.
(e.g. "traffic", "bulletin" "private", etc.)

7. Any notes which would improve understanding.

IV. WHERE TO SEND THE INFORMATION

Send your replies to any of the following:

n2dsy\@kd6th(packet)
n2dsy\@kd6th.nj.usa.hamradio.org.iso (iso/packet)
n2dsy\@hou2d!att.com (internet)
72417,652 (compuserve - use easylink)

If you have any questions or comments send them to me via any of
the email addresses listed above, or call me on the telephone.

Thanks + 73,

J. Gordon Beattie, Jr., N2DSY

Mike,

ARESdata was written by N6KL and WN6I for use here in the Santa Clara Valley.
It is essentially a free-form data base hooked up to a tnc. I believe it
can handle upto 8 connects at a time and requires WA8DED software in your
TNC. The program should run on any IBM compatible. I'm pretty sure they
just did a new release of the program in the last couple months. We use
it here in support of Red Cross operations, and or fire incidents where
we have to keep track of people's names, and their status. For instance,
you might use it to construct a central data base of people who have
checked into different shelters in a disaster area. I suspect I can
get you a copy of the latest and greatest if your interested. I'm not
sure if there are any copies on the available servers. Let me know
if you want me to pursue this.

I am new to packet radio, and thus have many questions which don't
all seem to be answered by the books I've read so far.

One big interest of mine is the ability to send a friend of mine
text every 3 days or so. This friend of mine happens to be on a
freighter in the Pacific. What are my options in reaching him, if
I am only equipped with a 2M rig and TNC from location here in Arizona.

My friend on the ship is equipped with HF and TNC. Is it possible for
us to keep in touch if I don't have the capability right now for hf?

If there is a way to contact him and stay in touch, would someone detail
to me what steps are needed to be successful in this endeavor.

Are there existing gateways via satellite?

I'm still not active on the air, just because I wish to become more
knowledgeable before jumping in there. I would appreciate any and all
direction by readers of this note.

Tnx & 73 ----WO7T-----Mark

>packet driver, none had worked.

If the ONLY difference between a working configuration and a non-working
one is the data rate on the serial link, then the problem is almost
certainly due to characters being lost by the serial controller chips. I
recommend that you try replacing the 8250 or 16450 chips with National
NS16550 chips, which have 16-level FIFOs built into the receiver and
transmitter.

These chips function just like 8250s unless they are explicitly put into
FIFO mode by software. Therefore you need to run a fairly recent "NOS"
version and use the built-in asy driver in order to take advantage of
the FIFO feature. ("Recent" means "within the past few months".) You can
verify that you have the right version when you issue the "asystat"
command because it will mention that a 16550 chip has been detected.

Can any Help ... ???
I have a need to run ARES data ... and of course I bought the wrong TNC.
The ARES-Data program came in a week after the TNC arrived. There was a
note from Weo NN6I who stated that the ARES-Data will not run on my new
KAM TNC because there is no 'HOST' mode.

Does anyone know of a work-a-round .. ?? If not is anybody interested in
a bran new KAM TNC that is cabled for KENWOOD ..??

Thanks in advance ...

Thanks, Steve, for posting the reply about ARES/Data!
You're fast! Steve's correct: ARES/Data is a computer program
designed to help collect and manage disaster information.
It's has three primary features:

1. It's a database.
2. It's accessible via packet radio from stations in the field.
3. It includes an integrated "conference bridge".

(Small detail is that the new version supports up to 4 TNCs,
each of which may have up to 8 or 32 connects).
For lots more detail, see the posting here on PACKET-RADIO on
1 Sept 89 (Digest V89 #193) which was a copy of ARRL's
GATEWAY Newsletter dated 25 Aug 89 (Gateway Vol 5, No. 24).
Also coming soon to the Proceedings of the 8th ARRL Computer
Networking Conference, and an upcoming W5YI Report.

I'm not familiar with how to upload the program to SIMTEL20,
but if anyone would like to do that, and the kind folks at SIMTEL20
agree, then please do! Also feel free to place the
program on other file servers or BBS-s.

(For Fred, N2JCD: Sorry about the lack of KAM support. It'd be
nice if WA8DED host mode were available for all TNCs. It makes
writing robust AX-25 packet applications much easier!)

We hope you never REALLY need this program.
We hope you have it on hand just in case!

Very 73,   Dave Palmer, N6KL   'n6kl@ibm.com'

Do you mean I can physically replace the 8250 on my serial board with
a 16550? Wouldn't there be some trouble with the difference between
edge and level triggered interrupts?

Has anyone actually tried this, and how did the 16550 perform compared
to the 8250?

I am interested in this because we use KA9Q as an SLIP-Ethernet IP router
here and it runs wonderfully at 2400 but not at all at 9600, and we would
like to run it at the higher speed.

Thank you very much for your time.

Yes, I've done this in my two PCs (one AT and one XT). They work just fine
with amateur packet radio TNCs, but I haven't actually tried it yet in
gateway mode with real SLIP. I set up the receive FIFO in the 16550 to
interrupt at the 1/4 full point, so at 9600 bps the code has an extra 12 ms
to respond to the interrupt. This is a big improvement.

I've laid hands on the 890421.1 source code, and have gotten it compiled
on my system, which runs Microport System V/AT (286 version) 2.4 with
DOSMerge. When I fire it up, though, it complains:
msgget smsgqid:: No such file or directory
This is being issued from axinit(), and is the first msgget call issued.
XOBBS is defined in the makefile. The error, according to TFM, is that

IPC_CREAT isn't being specified on a message queue create call - but a
cursory examination of the code shows that it is, indeed. Has anyone
run into this one before?

Please E-mail me; my inbound newsfeed is out for longer than was
expected, and I may or may not see a posted reply before next year.

Yes, it is very common practice on Fidonet systems running with a 19200 baud interface with the USR HST modems. Without the 16550 chips, some computers have trouble keeping up with the interrupt rate, resulting in lost characters, etc.

The procedure to change over is simple. Just get a 16550, pull the old chip out and plug the new chip in. Then obtain the software drivers, etc. that will access the special features of the chip.

I did that here on my landline BBS about 6 months ago or so and have had no problems. It enables my XT to keep up with the HST modem with the serial port locked at 19200 baud and saves significantly on the phone bill. Many other Fidonet mail hubs have done the same thing.

Walt

The 16550A is a direct replacement for the 8250 and 16450.

> Has anyone actually tried this, and how did the 16550 perform compared
> to the 8250?

The 16550A chips are worth the cost of the chip in high speed applications
(greater than 9600 baud). My machines' throughput on the serial lines
increased by 40% after replacing the 16450 chips with 16550A's.

I've just purchased an AEA PK-232 (as well as some other goodies!). I don't have possesion of the unit yet as I've been told that AEA is in the process of modifying the unit with a new "mailbox" feature.

Anyhow, I've been told that the MacRatt software for it (the Mac-ware that AEA flogs for the '232) is pretty difficault to get hold of... that PC ware was in greater supply. Also, frankly, after buying the '232, etc; I don't have $60 to spare for the blasted thing (even if I COULD get it!). Sooo, I'm looking elsewhere. Especially interested in WEFAX-ware.

Preferably something that could run under MultiFinder and happy with 6.0.3 would be nice. Any leads?

Many thanks,
Pete Ferris, N5KBD

   Sb: Computer Virus: Jail Time & Fines
```

On November 2, 1988 the great Internet Worm attack disabled approximately 6,000 UNIX machines across the country.

On July 26, 1989, Robert Morris Jr., a graduate student
at Cornell was indicted by a federal grand jury on a single
felony count of violating the Computer Security Act of 1987.
If convicted, Morrris could spend five (5) years in prison,
and be fined $250,000.

Mr. Morris has also been found guilty of violating Cornell's
Code of Academic Integrity and has been suspended until
the Fall of 1990.

If you know of anyone manufacturing computer viruses, or
that is contemplating them, be sure they're not ignorant
of the potential penalties.

As for the reports on packet that you should be concerned
about BBS systems, etc., hogwash. The virus requires that
you EXECUTE a program containing infected code. Reading
data messages on BBS systems does not run the risk of
acquiring a computer virus. If, on the other hand, you
download some .EXE or .COM program, and run it, all bets
are off. At that point, a program can alter sections of
code in the operating system software (IBMBIOS.COM, IBMDOS.COM
COMMAND.COM, or their equivalent Microsoft files). The two
hidden files (BIOS and DOS) are loaded everytime your system
boots up, and of course the command interpreter is run as well.

You can Unhide your hidden files, and run COMP (file compare)
on your own systems to check for any changes to these operating
system programs, as well as run COMParisons on other EXE or COM
programs if you suspect that one of your programs has been
infected.

If you believe you are the victim of a computer virus program,
it may be possible to trace it back to the author. If the
program has phrases like "Gotcha" or some such, it's possible
to scan EXE and COM files for the phrase (or phrases), find
the original program, figure out where you got it, and work
on its ancestry. Eventually, the source may be found, fined,
and jailed.

Good luck.
Jeff.

Hmmm. Have you got the latest bits? There have been a couple of problems
over time that got fixed. Try grabbing ~ftp/ka9q/890421.1/tnc_tnc1.arc from
col.hp.com if you have Internet access...

>for the "complete" package or at least as much as I can get.

No such thing exists. NOS is not officially released yet, and must be
considered "beta-test" software at best. There is *no* user documentation
specific to NOS yet.

>Also, I'm looking for a short tutorial on the operation
>of NOS.

This should be available sometime in November. For now, the specific problem
you are having is likely related to the change from a "hosts file" format
hosts.net file to a "resource record" format domain.txt file for host info.
Talk to your local nameserver wizard for help.

The latest source, bugs and all, is available from flash.bellcore.com, in
the directory ~ftp/pub/ka9q as file src.arc, caveat emptor!

Hmmm. I had some mail a while back that I've since deleted from someone in
Illinois who had similar problems with SCO Xenix, it turned out to be a bug
in the IPC code, and they sent him a new rev of the kernel to fix it... dunno
if that helps or not...

The Heath 4040 is a TNC-1 clone. Look for the tnc_tnc1.arc file included in the KA9Q package, and follow the instructions in the doc file.

Holler if it doesn't work.

A friend recently was given a TRS-80 model II with a 12MB hard drive. It appears to run both TRSDOS and CP/M. He would like to use the machine to run a WORLI (or similar) packet BBS. Since WORLI was originally written for CP/M it would seem likely that a version exists. Does anybody know if this is available and how to get it?

True as far as it goes, however if you run a terminal program which
has ansi escape sequences (or vt100 emulation or some other such
thing), jerks can still do bad things to your computer. Have you
heard of the 'christmas card bomb' which was a bunch of text you
displayed on your screen and which would use some 'nifty' :-(
escape sequences and operating system commands to attempt to delete
all files on your system. True, it was computer and OS specific,
but those people having the computer for which the bomb was designed
lost their files.

Of course, if you are using a terminal emulator, turning off ansi
(and other such emulation modes) should keep you safe.

If you are running an IBM (or compatible) computer, it would
be wise to (1) back up your computer prior to Friday the 13th
(Ahh, you forgot we have a friday the 13 coming up next week?
We do), (2) get a virus scanner or two and run them just to be
'sure' (is there any such thing?) you are clean, (3) perhaps
subscribing to comp.virus where you get the latest news of
viruses would not be a bad idea, (4) don't panic, its probably
not quite as bad as the anti-virus screamers would like you to
think, but then if you get hit by a destructive virus it would
be better to be prepared and watchful than blissfully ignorant
until your data went away.... So be prepared and don't panic.

Disclaimer - the above information is second-hand and probably has
some inaccuracies in it. Your mileage may vary. Poster not
responsible for bombs, trojans, or viruses which get loose on
your system. (Add more disclaimers here)

For good, solid info on viruses, bombs, trojans, and the like,
check out the newsgroup comp.viruses (which is where I heard
about the 'christmas card bomb').

'nuff for now. Don't panic. But do backup data, its a good

habit anyhow!

In article <4390066@col.hp.com> bdale@col.hp.com (Bdale Garbee) writes,
in response to my recent plea for help:
>Hmmm. I had some mail a while back that I've since deleted from someone in
>Illinois who had similar problems with SCO Xenix, it turned out to be a bug
>in the IPC code, and they sent him a new rev of the kernel to fix it... dunno
>if that helps or not...

This jives with mail I got from Dave Toth, who says that Microport's
message queues are broken. Rolfe Tessem, however, says that he has it
running on his Microport SysV/286 system, also at 2.4.

No matter what I try, though, I can't get it to run, and I suspect I'll
never see another kernel revision. :-(Guess I'll have to give up on
XOBBS, not through any fault of the code, but because of my
once-more-buggy system. Oh well.

I am a third year student here in King's College London, UK, and
I am doing a third year project which consists of designing and
building both hardware and software for an X.25 packet radio modem.

Unfortunately, at the moment I know very little about this. In fact,
I can say that I don't know anything about packet radio.

Could you please send me information about packet radio. How to
design a packet radio modem, writing of the software, etc.
In a word: help !

In order not to bore other people on this list, please send the information
DIRECTLY TO ME. I'll acknowledge all mail I receive, but please warn me before
sending me large amounts of data in one go (ie: large files/manuals...)

Many thanks for your help.

An admittedly cursory glance at the new (proposed? accepted?) part 15
rules leads one to believe that we hams interested in digital
transmission can legally avoid all the ham radio restrictions on signal
content by just turning down the power and ceasing to identify.

Bizarre thought, isn't it? (Thanks to K3MC for the inspiration.)

And you can do all that without moving out of the ham bands i.e. in the
902-928 MHz band.

Ron Parise, WA4SIR has provided the following information on his flight aboard the Shuttle on STS-35 as a Payload Specialist for the ASTRO experiment. Ron is hoping to carry the SAREX (Shuttle Amateur Radio EXperiment) Packet radio hardware with him.

Howdy folks!

Here are a set of prelaunch predicts for STS-35. They might change slightly prior to launch due to some new ascent performance predictions but not by much. These should do fine for any planning excercises you might wish to do. Also feel free to publish, E-mail, or otherwise scatter these numbers far and wide to get people started thinking about the mission. These are preliminary and are NOT yet official. By the way, our launch time is now April 26, 1990 at 05:02 GMT.

I'm posting this for a friend who has no Usenet access, and I don't
normally read this group (it's at the bottom of my .newsrc), so please
respond by e-mail if at all possible. Thanks.

I have a friend who is planning on checking out of the day-to-day world
next year and take off for the Carribean on his sailboat. (tough huh?)
However, he and his wife don't want to be totally out of touch and have
been thinking of getting some ham gear (and the appropriate general
license) to facilitate this. When he was there last year on vacation,
he saw one of the big problems with the ham setup was that everybody
was virtually married to the radio at certain times of the week and day;
and it may have been for naught if there had been no messages for you.
So, I mentioned that there was a possibility that packet-switched radio
would take care of this problem.
So the question is: will it fill the bill? Can things be set up so that
he can just turn on the ham gear, a laptop PC and some type of modem at
certain times of the day (maybe even leave the laptop on and let it turn
everything else on and off at the appropriate times)? I'm getting Phil Karn's
ka9q S/W down via anon UUCP, as I've heard that that is the s/w used for
this type of thing, but what else is needed?
Since everything has to fit in a 30 foot sailboat that's also their home,
space is at a real premium (so is money, but everbody has that problem :-))

Well, that's probably enough for the first round of questions. I'm being
intentionally vague in some areas, cause I don't even know enough to ask
all of the right questions, but I *THINK* I'll be able to understand most
of the answers.

Thanks in advance, and remember please respond via e-mail.

I've been thinking about this for a while. Remember, there's no
restrictions on the size of RECEIVING antennas...how far can we get
if we use big beams to receive minuscule signals?

>   - Brian

I mentioned this to Mike and Phil last year, but we wondered if there
might be more problems than would be immediately apparent.

There are some problems that I was not aware of at the time I proposed it then. The signals need to be spread spectrum, the spreading must meet some particular standards of energy dispersal, and there may be some FCC approval requirements of particular systems, such as type approval.

The spread spectrum nature would provide some protection against collisions, but would add the synchronizing time to each transmission. As such, it is much better suited to backbone transmitters which transmit continuously. At the 1 watt power level, reasonable range for links between mountaintops should be possible.

I have a method for using this with intermittent transmitters, but that would take a much longer article than this to describe.

Regarding the query from the party who was interested in taking messages at sea without having to meet schedules and nets on the air, my friend NA7P has solved this problem neatly and without complication.

He uses the WA8DRZ APLINK BBS, which has both a packet and AMTOR port. The packet side is tied into the VHF packet network that can send and receive mail from mailboxes all over North America (and elsewhere) and the HF side uses AMTOR on 20 mtrs, which is a lot easier for him to use at sea under normal HF radio conditions.

His wife at home, who is also a ham, addresses messages to NA7P @ WA8DRZ on a local VHF BBS in the Seattle area. The messages go via the packet network to WA8DRZ, and NA7P picks them up on 20 mtr AMTOR.

This way any ham with a computer, TNC and a 2 mtr radio can send
him mail. He uses an AEA PK232, an HF SSB transceiver and a computer
on the boat. Works real slick!

I have developed an interest in packet radio, in particular I am
interested in the operation of same under Unix/Xenix.

I am however, a bit bewildered by the selection of packet controllers on
the market.

I would appreciate hearing your views or experiances with various brands
and/or models.

I am concerned with reliability, flexibitity and upgradability as well as
the ease of use.

To date I am leaming towards the KAM and PK-232 but I may be making a
mistake in either case. Your input would be greatly appreciated!

Thanks,

Noel

Howard suffered a hard disk failure. When I spoke to him last week, he
was hoping that a replacement controller would be here "real soon now".
He has not been down "for several months" ... more like 3-4 weeks.
Hope this helps all those folks wondering.

I recently notice that packet addressing follows a format similar
to this.....

KU9C@KD9QB.IN.USA.NA

is there a reference to this new addressing .... is the IN always
the state, or section, or what? Also, does anyone have a good
source for worldwide gateways? For example, I am told that, to
send a message to Hong Kong, there is a Amtor gateway in the west
coast. How do I access it, or use it, to send a packet from Indy
to Hong Kong?

thanks in advance!

I use KA9Q net code to connect to our various network resources here at IU from time to time. Things like the emacs editor, though, have real trouble trying to work with KA9Q (through no fault in the software, that's not really something hams often have to worry about).

Is there an ANSI.SYS driver or something like that, or a code modification I could use to get net to work better with emulation?

Thanks

Is there a description of the Net/Rom protocol available anywhere?

I know that there is some Net/Rom stuff imbedded in KA9Q's TCP/IP package written by W9NK. Where did he get the info on the Net/Rom internals?

I am interested in writing some stuff that interfaces with Net/Rom and am looking for some sort of "standard" (though I suspect this may be wishful thinking on my part).

Any ideas? Thanks,

I had a very similar problem with a TNC-2 lashed to a Kenwood 2600 HT about two years ago. The problem turned out to be excessive RF getting into the audio cables... and from there into the TNC. The TNC's audio stage got semi-saturated by the RF, and thus the crunched audio. The quick hack to see if that was really the problem (it was!) was to put a ferrite toroid around the cables between the HT and the TNC. The long-term fix was to run 3 pieces of RG-188 coax (instead of the loosely shielded mic cable), one for PTT, one for TX, and one for RX. All three shields were bonded to the ground on the radio end, and left floating at the TNC end. It worked great. Beware of RF on the audio wires...

With the cover off my TNC-2 in the same configuration, the PTT would lock up because the FET saturated...

Best operating position was TNC sitting on top of TNC with TNC case grounded, and the above cable scheme.

I am no internet domain expert, but I seem to recall that ".COM", ".EDU", ".GOV", ".MIL", ".ORG", ".US", etc. are all domains within the

Internet domain. The Internet is a subdomain of the US DoD.

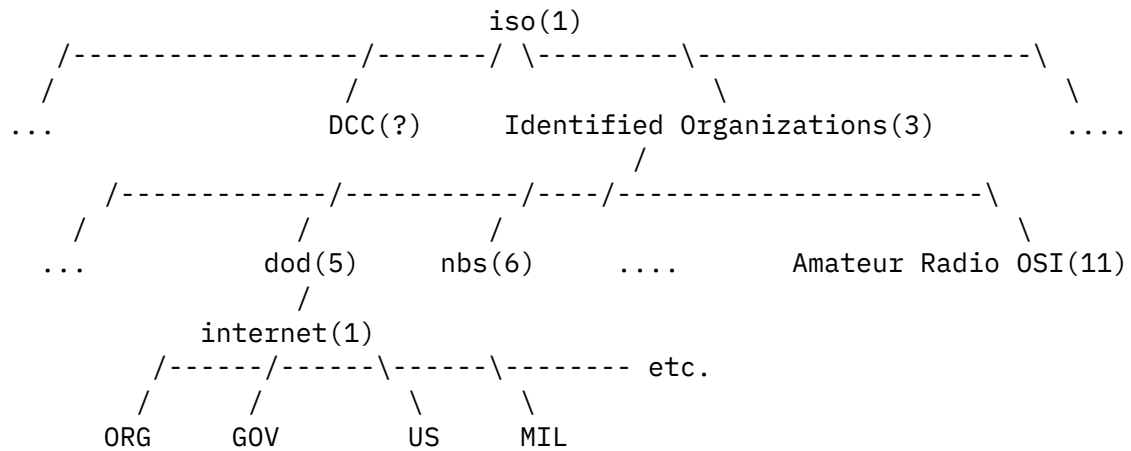
The next step is a bit unclear to me...is it "ORG" followed by "ISO"
as the last step in the hierarchy? This would yield a complete
string of:

"host.city.state.us.internet.dod.org.iso".

Can someone confirm/deny this?

I base this on the recollection that the DoD has one of
two domain IDs given to the US by ISO from its branch "Identified
Organizations".

A few years ago we obtained such a domain ID from ISO
for "Amateur Radio OSI" and we have broken it down by both
geographical and organizational lines as was done by the internet
folks. We have a few different branches, which are described
elsewhere, but I was somewhat curious how the internet handles
domains on other branches of the global domain tree.
The picture shown below illustrates my understanding,
could someone comment on this?



Thanks,

Havg a callsing in it doesn't make it suitable for the air. I have seen many postings in usenet from hams that wouldn't be suitable. Has the following been suggested: add a new field to the mail or news message called "Callsign:" or maybe "Amateur Call:" that would identify the message came from a ham and is suitable and intended to

go out over the radio. This way automatic gateways of rec.ham-radio
could be made.

If people couldn't get their mail or new software to do this then it
could be part of the message anywhere in the file ("^Callsign: ").

Any problems?

I normally don't respond to such idiotic postings but I felt a clarification
of my personal position regarding software is. I will clarify that I am
speaking now strictly for myself and not Sales Technologies.

Pat, I am one of the more enlightened programmers who realizes that
"theft of my product" is essentially a non-issue. I realize, as do most

shareware authors, that copying in and of itself is actually free publicity. Most people will buy a package that they make more than incidental use of if for no other reason than to get the manuals. I would much rather that someone buy my product because they have used a copy and like it than to loose that customer by insulting him with some bogus shrinkwrap license statement.

It comes back to how you view your customers. Yours and apparently Raikes' view is that the customer is the enemy, someone to be protected against and who is good only for his or her money. It's this view that leads to copy protection, bull sh*t license "agreements" and other plagues of our times. My view of the customer, on the other hand, is that of a friend and ally, someone who thinks enough of my product to buy it. I am an 'in abstencia' partner in his enterprise. And if he feels that my software is not good enough to buy a copy, then I don't really want an association. I subscribe to the theory that most people are basicly good and will do what's right. I sometimes have to illustrate what's right but that's no problem. I would probably get upset if I found someone profiting from my work but since that's never happened, I really don't know.

Actually all of the code I've written before comming to ST that is not customer-specific is in the public domain. Even with customer-specific projects, my contract reserves me the specific right to reuse code modules as I see fit including giving them away. You see, there is little business value in a piece of code, per se. Much more valuable is the design and execution.

This is, of course, tangental to the Nord><Link discussion so back to our regular programming.. PS: Try to think next time before engaging keyboard.

Some thoughts:

- A moderated gateway/newsgroup ensures only suitable comm gets out. Problem
  is, who's gonna moderate? If traffic mushrooms, it could be a time-consuming
  burden for the moderator.

- Filter scripts for the "no-no" words could kill the most obvious offensive
  stuff, but would be hard to determine commercial intent, etc. But, I
  could see a script that kicks off and if it finds offensive materials,
  turns the message around and back to the sender with an error message
  telling them what they did wrong.

All of this is assuming that the sender knows radio laws and is an operator.
But none of these ideas really provide me, the non-ham, with a way to get
mail to my packet friends. Is/would sending a piece of mail via a gateway
into a packet bbs tantamount to broadcast? Do I need a license? If I don't,
I'm sure the sysop would be responsible for my comm.

...doesn't seem like such a simple idea anymore... Hmm... maybe a CB radio
gateway.... :-)

Flaoting packet size is important. If the link is good go big,
if the link is fast go bigger, etc If the BBS want s 2 character
code , go small...

One thing I'd like to see is a multi-drop possibility. Ie, there

are two or three BBS's or personal machines. Let them eaves drop
on the BBS to BBS TX and when all the data is transfered. then
let each unit request the missing packets if any. This requires
some houskeeping, but it sure could keep the QRM down around here.

All thise people with dedicated packet system (running computer with
packete all the time) came get their mail and the BBS 'ALL' mail on their
machine and won't have to waste bandwidth with loggin onto the BBS
and read the same messages as everyh one else. Why do like usenet with
modems when we can share the information!! (yes I have worked on a
system which uses 8530 hdlc and multi-drop, we can download megabytes
on dozen's of different machines in dozen's of locations at the same
time).

I am operating an e-mail gateway between the Internet and ham radio
TCP/IP users. I read ALL messages by hand as they pass through
the gateway. I bounce messages that contain unpassable material.

I forward messages from non-hams all the time. The only restriction
is that I must be at my station controlling transmissions.

I have a very big problem with my tnc2 TARP 1.1.5 ! I am using an
Amiga computer A1000 with one serial port. The TNC2 work not nok via
the serial line i.e. sometimes by sending large strings to the TNC
letters are lost or destroyed. I have tested the parity by setting
PAR to 1, 2 ,3 ,0 there isn't any difference in setting PAR to

different values !!!! [WHY ?????] I have also connected the TNC to a
VME System and a MS-DOS SYSTEM with the same effect !!! What have to
be done to set the TNC to following parameters:

speed 9600
no parity
8 bits
1 stopbit
Handshake protokol !

???????????

Please give me a hint !

   All of this is assuming that the sender knows radio laws and is an operator.

Having a callsign field assumes exactly that, that the person sending
it is a ham and is directing it for retransmission over amateur radio.

> But none of these ideas really provide me, the non-ham, with a way to get

I think the laws that govern things like this are:

 --- No business transmission

 --- "Profane" language

 --- Communication between hams

Randomly feeding usenet over packet can break the first and second
rules above. Sending mail between non-hams could violate the third.

> ...doesn't seem like such a simple idea anymore... Hmm... maybe a CB radio
> gateway.... :-)

I guess the smiley means that you are aware that digital modes are not
legal for CB (I hope I'm not making this up...) I'll put in my $.02
pitch and encourage you to go for a ticket. The theory shouldn't be
bad for someone technically inclined and is useful. The code, even if
you never actaully use it directly can be useful to know and 5WPM is
very easy to learn.

>I am no internet domain expert, but I seem to recall that ".COM", ".EDU",
>".GOV", ".MIL", ".ORG", ".US", etc. are all domains within the
>Internet domain. The Internet is a subdomain of the US DoD.

I have an internet domain map (current as of 27 sep 88) hanging on
my wall, courtesy of SRI International (I think that they maintain
the host tables and do a lot of the internet routing).

The chart (12 pages) is organized like a subdirectory structure with
(oddly enough!) ROOT at the top.

According to this chart, valid domains are:

AR, ARPA, AT, AU, BE, CA, CH, CL, COM, DE, DK, EDU,
ES, FI, FR, GOV, IE, IL, IRL, IS, IT, JP, KR, MIL,
MY, NET, NL, NO, NZ, ORG, PT, SE, TH, UK, US

Then there are dozens of sub-domains below this layer, such as
UU below NET, and FIDO below ORG. It makes me feel very insignificant
when I think that my local cluster of over 30 Vaxs is 3 bubbles below
MIL!!

>The next step is a bit unclear to me...is it "ORG" followed by "ISO"

I don't see ISO anywhere on the chart.

Sorry, but I can only offer observations, not explanations about internet.
However, the current domain map (and a _lot_ of other stuff) is
available via anonymous FTP login to SRI-NIC.ARPA. I think it is
a .tar postscript file located somewhere under netinfo.dist.

Please *don't* do this. If you kick the mail back to the sender, and the
sender happens to be a mailing list redistribution point, then you're going
to royally torque a lot of folks... particularly the nice people who help to
distribute your mail and bulletins...

> If I don't, I'm sure the sysop would be responsible for my comm.

Current FCC rulings hold the amateur radio station which injects a message
into the amateur radio packet network responsible for the content of traffic
being passed. In other words, if you send mail through a gateway, the gateway
operator's neck is on the line, not yours.

Bdale

FOR IMMEDIATE RELEASE

For more information contact:
Lori Weinberg
American Radio Relay League
Tel: 203-666-1541
FAX: 203-655-7531

July 5, 1989

8th Annual ARRL Computer Networking Conference

The 8th ARRL Computer Networking Conference will be held in Colorado

Springs, Colorado, at the Air Force Academy in the Fairchild Hall conference area on Saturday, October 7th. This year's hosts are: Tucson Amateur Packet Radio (TAPR), Academy Amateur Radio Club, USAFA Cadet Radio Club, Rocky Mountain Packet Radio Association (RMPRA) and the American Radio Relay League (ARRL). If you plan on presenting a paper, please contact Lori Weinberg for an author's package. Deadline for receipt of camera-ready papers is August 28, 1989.

Conference headquarters will be the new Colorado Springs Marriott. Special conference rates are: Single room, $45; extra person in room, $13. Reservations should be made by September 6, 1989. After this date there is no assurance that space or the special rate will be available. When calling for reservations, call the Marriott direct at 719-260-1800 (do not use the Marriott 800 number). In order to get the special rate, be sure to identify yourself as a member of the "ARRL Networking Conference."

Other nearby motels:

		1 person	2 persons
Comfort Inn	719-598-6700	$40	$45
Sheraton Inn	719-598-5770	75	85
Drury Inn	719-598-2500	42	48

Colorado Springs Municipal Airport is approximately ten (10) miles from the Marriott. It is served by six national carriers with over 100 flights daily from six major gateway cities: Chicago, St. Louis, Dallas/Ft. Worth, Phoenix, Salt Lake, and Denver. Airport transportation to and from the airport will be provided by the Marriott. Arrival and departure times should be coordinated with the hotel transportation staff.

For those arriving before 3 PM on Friday, October 6, a conducted tour of the Air Force Academy has been planned. The assembly point for this tour will be announced in a later bulletin and will be posted at the hotel registration desk. Private transportation will be used. If you need a ride, let your needs be known when sending in your registration fee.

On Saturday evening (6:30-10:00), there will be an opportunity to get acquainted at a special (and informal) attitude adjustment session at the Marriott. A full-size Taco buffet ($2 per pass through the buffet) and cash bar will be available.

For those planning extra time in the area, the Pikes Peak region offers a wide range of attractions. You can take the world's highest cog railway to the top of Pikes Peak or drive the scenic Pikes Peak highway. You'll be amazed at what an HT can do from 14,110 feet. Also, nearby are Garden of the Gods, Seven falls, the old mining towns of Cripple Creek and Victor, the Royal Gorge (home of the world's highest suspension bridge), and the US Olympic Training Center.

Registration for the conference is $20.00. This fee includes the conference, one bound copy of the 8th Networking Conference proceedings, refreshments throughout the day, lunch at the AFA Officers Club (transportation will be provided) and use of the Marriott hospitality room. There will be no charge for the conducted tour of the Air Force Academy.

Extra copies of the conference proceedings will be available at $12.00 each.

Upon receipt of your registration fee, you will be mailed a preprinted Marriott reservation form and other materials of interest. Please indicate if you would like to be included in the Air Force Academy conducted tour. Send your $20 registration fee (make checks payable to Andy Freeborn), along with your name, call, address and telephone number to:

TOUR OF THE SCIOTO RIVER VALLEY WITH PACKET RADIO

The Central Ohio Amateur Radio Emergency Service used packet radio on Mother's Day weekend, May 13-14, in support of the annual bicycle Tour of the Scioto River Valley (TOSRV-89). Portable packet-radio stations were set up at the start, finish, three rest and food stops, and the TOSRV net control. Numerous messages were handled for the bikers such as "Have been delayed by rain at Circleville food stop, wait for me at Lake White." A few concerned damage to cyclists or their cycles. Packeteers involved were

W8BKO (net control station), W8ELE, WA8YUO and W8MDK. The K1LT-3 and K1LT-4 digipeaters were set up in conjunction with a linked 2-meter voice repeater system to provide both packet radio and voice coverage over the entire 105-mile route. Some 60 voice FM operators were positioned and in communication with ambulances for medical support.

The N8XX Portable PBBS was set up at Lake White State Park, Waverly, Ohio using a borrowed Toshiba T3100 with W0RLI version 9.07 software. W3EOA and N8XX solicited about 140 messages from the bikers. Most of these were third-party messages from participants to their relatives and friends and were handled as such via AD8I and the packet-radio network.

TOSRV is one of the largest bicycle tours in the United States with some 6500 cyclists from all over the country. It involves a 210-mile jaunt from Columbus to Portsmouth, Ohio, on Saturday and a return trip on Sunday. It is a sight to behold! For more details on the network and modus operandi contact Bob Adams, W8BKO @ W8CQK, or Vic Keane, K1LT @ W8BKO.

by Hank Greeb, N8XX

N8EMR NOTE:.... K1lt can be reached at k1lt @ w8cqk and not w8bko...

SAREX 2 COMES TO LIFE

The NASA Johnson Space Center Amateur Radio Club proudly announces the birth of SAREX 2. On May 30 at approximately 8:30 PM, the redesigned SAREX 2 hardware was first brought to life. Included in this new equipment is the Heathkit HK-21 micro TNC (donated by Heath) and the original SAREX SSTV system. The replacement of the original power supplies with new supplies (donated by the ARRL Foundation) has made this new design possible within the existing SAREX package while improving power efficiency and at the same time reducing the weight of the system. The SAREX prototype looks like a newborn, an ugly set of wires and bread boards strung together with cables and wires, beautiful only to its mother (the SAREX 2 team).

The first cries of the newborn were TV pictures on the monitor and captured images on the SSTV system operated by Lou McFadin, W5DID. Further cries were then heard by a portable packet-radio station setup a few feet away when Gerry Creager, N5JXS, and Don Noble, W5CLW, exchanged connects. Jerry Coles, KB5ARA, and Dwight Andrews, KA5IYI, fellow SAREX 2 team members, also participated in this historic event.

from Jon Bloom, KE3Z

PACKET RADIO AT HAMCOM '89/ARRL NATIONAL CONVENTION

Overall, the packet radio aspects of HamCom '89/ARRL National Convention in Arlington, Texas, went off without a hitch on June 2-4. The packet radio forum, sponsored by Texas Packet Radio Society (TPRS), was a great success this year with attendance on Saturday morning of more than 200 people and continuing the rest of the day with approximately 100 people for all the various forum talks. The Sunday morning recaps increased in attendance from last year. TPRS videotaped the entire forum and will be releasing

some of the presentations for public usage later this summer through the ARRL and TPRS.

There will be some changes in next year's packet radio forum at HamCom '90. These should include making the discussion panel segment better (longer) and adding more advanced topics to the forum.

The TPRS booth was very busy answering general packet-radio questions and showing TexNet to new users. John Koster, W9DDD, lugged his RICH node, which was renamed HAMCOM for the convention, up to the Sheraton. This allowed the convention area access to the Texas TexNet network. The W1AW/5 station operated packet radio on the 2-meter local access port frequency of the HamCom TexNet node during the convention which allowed contacts to made to W1AW/5 throughout the state.

The TPRS Annual Business Meeting was held Saturday. The bylaws motion to increase the board of directors to five was passed. Elections took place with the following members voted in as directors:

2-year terms:

Harry Ridenour, N0CCW - Jim Brooks, W5ERO - Will Summers, WR5C

1-year terms:

Greg Jones, WD5IVD - Carl Finke, WB5DDP

At the board of directors meeting the following officers were appointed:

Harry Ridenour, N0CCW, president
Greg Jones, WD5IVD, vice president
Will Summers, WR5C, secretary
Rick Russel, KF5RN, treasurer.

Saturday afternoon also saw the TPRS/AMSAT/TAPR hospitality suite in the Sheraton which started at 5 PM. Tom McDermott, N5EG, of TPRS and Bob Goodman, AA5FR, of TPRS and AMSAT set up the suite. Rumor has it that there were six other hospitality suites in the hotel and ours was one of the best attended.

TCP/IP IN JAPAN

The Oimo Club of Japan has developed a news distribution system that runs with KA9Q TCP/IP software package. It is called the "Terakoya" system, and consists of three different programs: "yomi," "kaki" and "soroban." These programs are the news reader, news poster and control programs

respectively. This system basically conforms to RFC1036 with some added extensions for Amateur Radio use. When a station posts a news item on his KA9Q system, it will distribute a control message called "ihave" to his neighbors. The neighbors check if they already have this news and they will reply "sendme" if they do not or "alhave" if they do. After getting "sendme" messages, the ihave station distributes the news to his neighbors.

One of the other extensions are the "addme" control message that has the following format:

addme newsgroups hostname

(for example, addme ampr jk1rjq.ampr.jp)

If the system receives this message, it automatically adds his/her entry to a news/lib/sys file to start sending/receiving news messages after receiving it. Because there are so many hams who do not want to maintain the system, but want to run the news system, maintaining the sys file automatically is essential.

Yomi is not released yet. It will be programmed by Toshihiko Oka, JF3KOA, and will have the same interface as "rn." (At this time, "tyu" [the "Tiny Yomi Utility," developed by Kazuhide Watababe, JE7LQS] is used instead of yomi.)

Kaki was programmed by Shigeki Matsushima, JK1RJQ. It is used for posting news and sending some control messages like addme, sendsys and version to the other hosts. This program invokes an editor to write messages.

Soroban was programmed by Dai Yokota, JK1LOT, and is the main program of this terakoya system. It works as the interface to the other hosts communicating with the other hosts using mail. The address to the soroban is fixed at "rnews@hostname." All news and control messages are sent/received to this address on a closed host which has sent the "addme" control message. If news is received at this address, it will be stored in the appropriate directory according to "Newsgroups:" header field.

Copies of this system, including source code, are available, but, at this time, the manuals are in Japanese only. English manuals will be prepared as soon as possible. (The source code will be sent to Bdale Garbee, N3EUA, for now.)

The Oimo Club was organized by Shigeki Matsushima, JK1RJQ, and Dai Yokota, JK1LOT, in 1989 for the enjoyment of programming and has developed programs for Amateur Radio. One of them is "oimo," which is the mailer for the KA9Q TCP/IP software package user and is upwardly compatible with BM (Bdale's Mailer). It can handle the Kanji code, the so called Chinese characters, and has many more features.

If you want to know more about terakoya system and/or oimo mailer, send an SASE to:

Shigeki Matsushima

1-4-25 Sakurazutsumi
Musashino, Tokyo 180
Japan

Or you can contact:

PRUG (Packet Radio User's Group)
PO Box 66
Tamagawa Post Office
Setagaya, Tokyo 158
Japan

from Shigeki Matsushima, JK1RJQ via CompuServe's HamNet

QSL MANAGER SERVER ON THE AIR

For those of you on packet radio who are also interested in DXing, a "server" is on-line at the W1NY PBBS. This server keeps a database of stations, their QSL managers and information requests. You can submit a request to the server for a particular station's QSL manager. If the server has the information, you will get the information back right away. If the server does not have the information you request, it will store your request and send you a message when the information becomes available. You can also use the server to find out what QSL routes are being requested and you may update the database.

To get help on the server, send a message to QSLMGR @ W1NY. The subject of your message will be ignored by the server. Put the word help as the only word in the body of your message. If you would like to see a few samples of input to the server, send a message to the server with the word sample as the only word in the body of the message.

If you have any questions about the server, please contact Bob Lafleur, NQ1C @ W1NY.

from Bob Lafleur, NQ1C @ W1NY via CompuServe's HamNet

Gateway: The ARRL Packet Radio Newsletter Part 3 of 3

Stan Horzepa, WA1LOU, Editor - Volume 5, Number 20 - June 23, 1989

TCP/IP QUESTIONS CAN BE ANSWERED

Recently, an increasing number of people have been asking questions about the various non-PC versions of the KA9Q TCP/IP code. Unfortunately, KA9Q is unable to answer them. The only version of the code he deals with directly (and can answer questions about) is the new "NOS" version in Turbo-C for the PC running MS-DOS. This code is currently in experimental field test.

Several others have contributed greatly to the amateur TCP/IP effort by porting the KA9Q code to other environments. In many situations they have

contributed major enhancements of their own. Since there are not enough hours in the day to keep up with all that is going on, KA9Q cannot answer questions that are specific to those versions, however, the following people have agreed to act as contacts for these other versions of TCP/IP. Please contact them directly if you have any questions.

"pre-NOS" PC: Bdale Garbee, N3EUA
System V/Xenix: Bob Hoffman, N3CVL
Apple Macintosh: Doug Thom, N6OYU

from Phil Karn, KA9Q via CompuServe's HamNet

BOY SCOUT JAMBOREE EQUIPMENT DONATIONS

Kantronics, Inc and RF Concepts have donated units to the 1989 National Boy Scout Jamboree to show their support for Scouting's role in the growth of Amateur Radio. The 1989 Jamboree will be attended by approximately 34,000 scouts and leaders. (See August 1989 QST for further information.)

IARU REGION 1 BAND PLAN FOR HF PACKET RADIO

According to the HF band plan for IARU Region 1 (Africa, Europe, the Middle East, Mongolia and the USSR), the following subbands are recommended for packet radio:

3.590-3.600 MHz
14.089-14.100 MHz
21.100-21.120 MHz
28.120-28.150 MHz
29.200-29.300 MHz

from cq-DL

AMATEUR RADIO SATELLITE LAUNCH SCHEDULE

Recently, Tom Clark, W3IWI, talked with Eduardo Dias, who is the manager of a satellite tracking station in Santiago, Chile (this was one of the tracking stations which supported the launch of the Japanese H-1 rocket that carried FO-12). Eduardo mentioned that the next Japanese launch of a H-1 rocket has been set for January 23, 1990 and he said that he had been contacted by the JARL and asked if he could provide Amateur Radio support since JAS-2 will also fly on this mission. JAS-2 will be the "follow-on" to FO-12.

A quick "run-down" of all known Amateur Radio satellite launches scheduled for next several months follows.

Satellite	Launch Date
RS-12/13	06/??/89
PACSAT	11/09/89
LUSAT	11/09/89
DOVE	11/09/89

UoSAT D	11/09/89
UoSAT E	11/09/89
JAS-2	01/23/90

from AMSAT News Service

GATEWAY SPARED

The next issue of Gateway will be published three weeks hence instead of the usual two weeks hence. This three-week break between issues occurs twice a year because Gateway is published only 25 times-per- year, which, on a biweekly publication schedule, leaves two weeks to spare. So, one week is spared now and the other week during the Christmas holidays.

GATEWAY CONTRIBUTIONS

Submissions for publication in Gateway are welcome. You may submit material via the US mail to:

Gateway
Stan Horzepa, WA1LOU
75 Kreger Drive
Wolcott, CT 06716-2702

or electronically, via CompuServe to user ID 70645,247. Via telephone, your editor can be reached on evenings and weekends at 203- 879-1348 and he can switch a modem on line to receive text at 300, 1200 or 2400 bit/s. (Personal messages may be sent to your Gateway editor via packet radio to: WA1LOU @ W1AW.)

The deadline for each issue of Gateway is the Saturday preceding the issue date (which is typically a Friday).

REPRODUCTION OF GATEWAY MATERIAL

Material may be excerpted from Gateway without prior permission, provided that the original contributor is credited and Gateway is identified as the source.

The following was mailed, along with the ARRL announcement, to about 500 packeteers in Colorado and adjacent states. I'm posting it here because I think the Sunday stuff may be of interest to other attendees as well...

73 - Bdale, N3EUA

July 1989

Fellow Packeteer,

The enclosed flyer announces the ARRL 8th Computer Networking Conference to be held in Colorado Springs. From the title of the conference you may conclude that it will be of little interest to you....don't believe it, the title is somewhat misleading. These conferences deal with PACKET RADIO.

The first seven conferences were held on the west coast or in the east. Not this year though. Colorado Springs is reasonably convenient to get to for all receiving this letter (the mailing list was provided by RMPRA).

The Saturday session at the Academy will include prominent amateurs who are doing packet radio development work at the leading edge of technology. They'll be speaking about their current efforts in the areas of packet satellites (PACSAT), networking (TCP/IP, TexNet, ROSE), the new version of AX.25, digital signal processing (DSP), high speed packet (10MB/sec), new packet hardware and packet software developments and many other fascinating development efforts now in progress.

There will be TWO concurrent sessions at the Marriott on Sunday. The ARRL Digital Committee will be in open session and amateurs are welcome to observe. At the same time, the Rocky Mountain Packet Radio Association will be hosting their annual Packetfest in a separate meeting room.

The RMPRA Packetfest will feature many of the prominent amateurs in attendance for the 8th Networking Conference and the Digital Committee meeting. The Sunday session will be of the tutorial/discussion/Q&A type of presentation.

The Saturday night Taco social session at the Marriott will be a great opportunity to eyeball with some of the folks that you have been packeting with and to ragchew with some of the Saturday and Sunday Speakers.

Please pass this information on to your local club newsletter editors. If you can take a few minutes at your next club meeting to announce the above

information it will help to spread the word. Thanks.

If you are interested in packet radio and what lies ahead in amateur digital communications don't miss this opportunity.

73, and hope to see you there.

Andy Freeborn, N0CCZ
Conference Coordinator
President, Tucson Amateur Packet Radio (TAPR)

Has anyone made the combination of this tnc/ht work on packet.
I'm using an IBM PC and have the mfj1284 starter kit which
includes PTP and MT - both comm programs. I can talk to the
tnc from the computer, but want to know ahead of time if I
need to make up any kind of special circuit like this kind
that was mentioned in this artice by Jim Price K6ZH back
in Sept 87. Thanks very much.

-Carl WA3UEN-

****
First a thanks to the rec.ham-radio folks who responded to my
request for info on the FT727. Two bands for a little more than
the price of one seemed like a good deal, and I bought one last
week.

Now, I'd like to use the thing on packet. A while back some
kindly soul here on the net posted an RC coupling circuit that
would allow use of Icom HTs (e.g. IC-2AT) on packet. The
circuit coupled the mic line from the TNC (thru a .01 capacitor)
with the PTT line (thru a 22K resistor) which then plugged into
the HT's mic jack as a combined signal. This odd arrangement is
necessitated by Icom (and Yaesu) not bringing a PTT line out to a
connector.

Now, the AEA PK-232 booklet says the SAME circuit will also allow

the FT727 to work on packet. But mine doesn't. I can receive
packets fine, but the HT won't key in response to the TNC's PTT
signal. Do I need to diddle the value of the resistor? Is there
some fundamental difference the in mic keying circuits that AEA
is unaware of?

Bottom line: has anyone got an FT727 working on packet, and if so
how'd you do it? I have an MFJ-1270 TNC, by the way, whose
documentation suggests a transformer coupler.

> message called "Callsign:" or maybe "Amateur Call:" that would identify
> the message came from a ham and is suitable...

I haven't seen this before, but it isn't going to be a very useful solution.

First, do you really want to pass any message that some bozo has tacked a
"Callsign:" header onto? I put one onto this message for the heck of it. My
ability to do so had absolutely nothing to do with my having a valid license.
There is *no* guarantee that only amateurs will do so, and even if this were
true -- do you really trust all amateurs to post proper material? I don't.

Second, you need to screen material in *both* directions! Almost any packet
setup can send any message with any callsign. Wanna keep your gateway...??

Last and least, since it isn't an "official" header type, it'll get stripped in some gateways and mailers. Sure it's a pain, but some folks object to all of those "Zippy-saying-of-the-day:" and "Moon-phase:" headers ;-).

To my mind, the only full solution would be a parallel usenet of amateur-only lists and/or lists fully moderated on the amateur side. This would require lots and *lots* of volunteers - I have heard rumors that the full Usenet load is currently about a megabyte a day! (Enlightenment is expected)

Anyone have a good, free, PC based newsreader and NNTP-over-KA9Q package yet?

Best of luck, -john KA4JSI

I had to change the resistor in my KPC-4 to get it to key an FT203. I
think the original resistance was 10k and I dropped it down to around 2.2k.

Good luck

I haven't seen this before, but it isn't going to be a very useful solution.

First, do you really want to pass any message that some bozo has tacked a "Callsign:" header onto? I put one onto this message for the heck of it. My ability to do so had absolutely nothing to do with my having a valid license. There is *no* guarantee that only amateurs will do so, and even if this were true -- do you really trust all amateurs to post proper material? I don't.

I would make the analogy to a normal ham repeater. The ability to push a PTT has nothing to do with a license either. The header field is only used when appropriate. Forgery would be the same as bootlegging on a repeater now. It happens, is dealt with and unless it becomes a serious problem I don't see it as a reson not to implement this or a similar scheme.

It has a chance of working, is simple, is entirely voluntary and I don't see any other way to automate things. Does anyone see any real legal *reasons* against this? I have already thought of lots of "what if"s like this.

"Don't Ever Antagonize the Horn"

Greetings!
It has been a while since I have made noise here...

I would like to let you *all* know that the ROSE X.25 Packet Switch is
now operational. It is VERY stable and is ready to be deployed to it's
fullest. If there is any interest I would be happy to send out some of
my standard "propaganda" messages, it might be easier to get abused, oops
I mean get questions...

It is currently in use in about 15 states and over a dozen countries.
Yes it DOES work!

Here is a breif overview of the features...

[well maybe no so brief...]
What is the ROSE X.25 Packet Switch?

The ROSE Switch is the first Amateur Packet Networking program that
uses the International Standard protocol for packet networks, CCITT X.25.

The program is meant to be installed in place of the EPROM found in a TNC-2
(or Clone) packet controller. It is not meant for User Terminals, but for
Network Facilities such as a Digipeater, a NET/ROM, or TheNet EPROM.

ROSE X.25 Packet Switch offers the following features:

* Hop-by-Hop Acknowledgements between Switches - provides reliability and higher throughput.

* On-line Information - Information/Help bulletin.

* FCC and foreign PTT acceptable AX.25 Level 2 SOURCE and DESTINATION Identification - the call signs of both the station of origination and termination appear at each end of the connection.

* Proper Transmitter Licensee Identification - Switch always identifies its transmissions with its own call sign, not the call sign of ANY user. Call signs traverse the network without ANY changes.

* Backbone is Fully Transparent to Users - Can add or remove Switches in the backbone, change call signs, bands/frequencies without having to inform users or modify BBS forwarding files.

* True Implicit Addressing - Only need to know the address of the desired exit point of the network, not all the intermediate steps.

* Network Determined Routing - Network manager determines best path, eliminating need for broadcasting of routing information to other switches.

* Dynamic Route Selection - Network will automatically attempt alternative paths to remote switches, based on information that the Network Manager provided.

* Predetermined Network Paths - Network manager tells each switch which paths to use, will not attempt impossible links because another switch was heard during a band opening.

* Support for Emergency Operations - A switch can be added to the network to provide service from the afflicted area without modifications to the existing network.

* Security System for Remote Control - authentication of user who requests to view or modify configuration.

* Common Hardware base among vendors - The ROSE X.25 Packet Switch runs on ANY TNC-2 compatible TNC, (TAPR TNC-2, AEA PK-80, MFJ 1270, Pac-Comm TNC-200 Tiny 2, Micro-Power, as well as the Pac-Comm DUAL Port DR-200)

* Full Radio Support on Asynchronous Port - The Asynchronous port of a TNC can be attached to a 202, or any other modem with an RS-232 interface and Radio, providing a dual port system. The second port is AX.25 using the Asynchronous Framing Technique (AFT) that was proposed by Toby Nixon of Hayes, which is pending CCITT adoption as the accepted method for sending X.25 over asynchronous links.

* Multi-Synchronous Ports using TNC's - Since the Asynchronous port has full radio support it also can support one or more switches via a special (commonly available) RS-232 cable.

* Complete Remote Configuration - All configuration is done over the air, many parameters can also be burned into the EPROM.

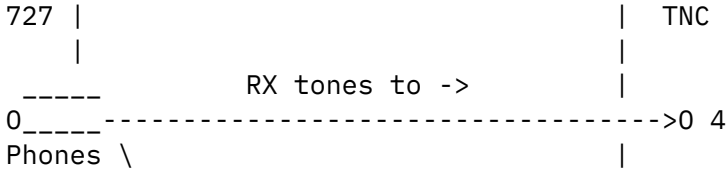
I use the FT-727 with a 1278 on packet. Here is the scoop:

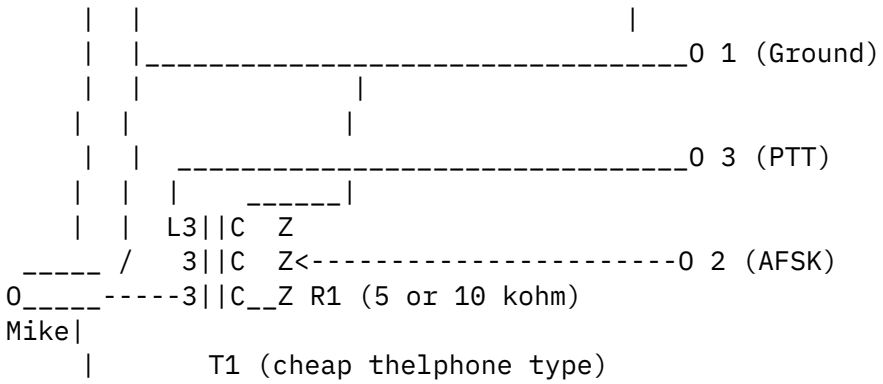
The TNC has 4 lines out:

1. Ground
2. AFSK - out
3. PTT
4. Receive tones in

The audio is superimposed on the key line.

T1 in the following diagram is a miniature line transformer - about 3/4 inch cube. 600 ohm to 600 ohm, or anything that works.





73s and good packeting

A few days ago, I came across a neglected article that described a service called "fidograms". According to the article, telegrams for non-profit use can be sent to one of two FidoNet sites in North America and they will be delivered, free of charge, to anyone in North America and some other countries by telephone. The article further says that HAM radio operators participate in this service to help them practice their emergency response measures.

Since this article is quite old, I sent some mail to the suggested sites asking if they are still in that business but I have yet to receive

any reply. Does anyone know if this service is still offered and what sites such telegrams should be mailed to?

I am now planning on purchasing a TNC, thus entering the world of packet radio, but I have some questions about packet and its capabilities. I have read WA2ISE's recent operating guide for beginners, but I am not even a beginner yet. If any of you experienced packeteers would like to answer these questions (here or via Email), I would be glad to summarize for the benefit of fellow pre-beginners, the interested, and the curious.

1. Are there TNC kits? Schematics? Or some other CHEAP way to get started? I already have computers and 2m equipment.

2. Can an HT be used?

Packet radio seems to me to be the ideal way to handle traffic, and therefore, emergency traffic. It is fast (no spelling out names, repetition, etc) not easily monitored by eavesdroppers with scanners, and appears to have message direction as part of its very essence. So:

3. Is there much traffic being handled?

4. How extensively networked are packet stations? Can I send a message cross-country via packet to my aunt Minnie?

5. What would happen if the information flow increased sharply, as would happen in an emergency or disaster situation? I guess this could be tested by having as many people as possible get and save up as many pieces of traffic as they can for a week, then dump them all into the system on, say, Field Day.

6. Besides 2m, what other bands are frequented by packeteers?

7. How well established is packet radio? That is, are there some frequencies used for digipeaters, others for nodes, and still others for internode links (if there is such a thing)?

Perhaps asking so many questions is a shameless abuse of this forum. If I get enough replies telling me so, I hope at least one contains a reference to a source of the information I am after.

Thanks in advance to anybody who helps.

I am a member of the National Traffic System and routinely handle such messages. There is a national network of amateur radio operators that meet many times per day at set times and on set frequencies to handle third party messages (traffic).

The system starts out at the local level, with a "net" covering a city or small geographic area. One person collects any messages leaving this local area and takes them to the state or section net and one person goes to that net to get any traffic coming into the local net from the section net.

From the section net, the same thing occurs between the section net and a regional net. Typical of the coverage of a regional net is Twelfth Region Net (TWN) which covers Wyoming, Utah, Colorado, New Mexico and Arizona.

From the region net the same thing is repeated to and from the area net. These nets cover roughly the Eastern, Central and Pacific thirds of the US and Canada. There is a group of experienced hams known as the Trans Continental Corps (TCC) that is responsible for handling all of the traffic flowing between the area nets. This handling is all done outside of the net structure but on assigned schedules (skeds).

There are only a couple of restrictions on the third party traffic -

1. NO commercial or business communications of any sort. If you think the autopatch owners are fussy about what they handle, most NTS ops take this requirement even more seriously since the rules are very explicit about third party traffic and business comm.

2. Maximum size per radiogram should be held to 25 or 30 words in the body of the message (not counting address or signature). If needed send several messages to the same person but keep each short.

3. Include a telephone number of the addressee. I, for one, will not mail a message I get with no phone number. I have handled up to 999 messages in one month and I can not afford to do someone elses mailing.

I will be happy to put messages for anyone into the NTS if you E-Mail them to me. They make neat ways of wishing someone happy birthday!

     Your pardon for me as well if this is overstepping bounds. I have
just begun immersing myself in different aspects of radio communication, but
packet radio unix (I am a computer junkie <sob>) is a subject that I'm
fascinated by the "most." Please, de Lyle, if any info comes your way, email
me, I'll owe you one... to the experts of the group, any info will be muchly
appreciated!

Thanks,

Tim Murphy

From the number of requests for additional information I have decided that
I should post the following overview of the ROSE X.25 Packet Switch.

Here is a brief overview of the ROSE X.25 Packet Switch

The ROSE X.25 Packet Switch is the most advanced network level package
for the TNC-2 (and Clones) with support for the PacComm DR-200 Dual port,
and soon 4 port operation. The ROSE Switch also supports asynchronous
packet on the RS-232 port of most TNCs, which can either be used over the

air or tied back-to-back with other ROSE Switches.

The ROSE Switch is the only Amateur Networking package based upon the International Standard protocols, as defined by CCITT and ISO.

The ROSE Switch fully conforms to FCC identification requirements, and does not waste channel bandwidth with needless broadcasts or beacons and has lower protocol overhead increasing actual data throughput.

The ROSE X.25 Packet Switch does not to have seperate ID Beacons, nor does it need to go key down for hours (so it seems) Broadcasting network routing information, the ROSE Switch does NOT speak unless spoken TO!

You do not have to guess what station a transmission came from, since the call sign of the switch appears in every transmission.

You do not have to poke your way through the network, paging through obscure node names to try to get to the town you want to reach, nor do you need reams of network maps, your phone book will do.

For more information please send a message to Tom, W2VY@KD6TH or (see below) or call me at (201) 478-7919.

(I am most accessible via packet or phone... this one costs money (dialup))
73, Tom

Cris at TAPR had a baby girl!

Thirty minutes after arriving at the hospital yesterday afternoon Cristina (Cris), our office manager, gave birth to a brand new baby girl. Mother and baby are doing fine.

The baby came about two weeks earlier than expected. This disrupts our well laid plans for transitioning the office functions to Heather Johnson, N7DZU.

The office will be temporarily closed for a short period. The recorder will be on the telephone line to accept urgent messages. Expect the office routine to return to normal about August 3rd.

We are planning to put up a 56 kbps TCP/IP packet radio network. Now we have now pretty much come to the point where we must make the decision of ordering (and building) all the necessary equipment.

We do still have some questions, however:

Which is the best interface for IBM PC-compatible machines? Should we use the Pac-Comm PC-100 (is it supported by KA9Q NET software yet?), or something else? Opinions, please!

As far as I recall, Mike Chepponis (K3MC) is working on a better interface. I wonder when that would become available? And when would the software support it? Does anyone have any idea of this? We would hate to pour a hundred dollars to a packet driver, just to find out that 2 months later there would have been a much better one out!

Another point of interest would be the possibility to link the system
to other computers than IBM PC-line. Is it possible at all, apart from
the old, painfully slow TNC's? We would like to try (at least)
Commodore Amiga, Apple Macintosh, Convergent MiniFrame running SysV,
Sun 2, maybe others... Last spring, somebody asked about the
connection to Sun workstations, any answers to that?

ANYONE who knows the answer to ANY of these questions, please reply to
this newsgroup, or directly by mail. The decisions will have to be
made within a month or so...

Thank You in advance, 73

        Luru

I am looking for a packet BBS to run on a Tektronix 6250 workstation, running
Utek.

I think what I am looking for Is KA9Q's package, but I am unable to download
it from anywhere due to the fact that I can only use KERMIT.

What I need to know is file names of what to look for if I run it to
it on any other systems. Or if someone could mail it to me that would work
out real nice.

Here in Atlanta we are still using a chopped up TNC2 on all our backbone links. We are experimenting with several plugin cards, but are sticking with the proven TNCs until we are sure we have something better working.

My opinion is that we really need some intelligence on any plugin we wind up using. The need to off load the main cpu is very real when your switch is attempting to service multiple high speed links. With the TNC hanging on the modem, most any computer that can run KA9Q will be able to use 56k. I am eagerly awaiting Mike's totally awesome board. It sounds like it will be a very good solution for the PC world.

The DRSI card seems adequate if you only need to drive one 56k, but if you need to switch multiple links, it will probably prove unfit for

the job.

Greetings everyone.

Yet again do I present a question concerning the use of the PC*PA, G8BPQ
Packet Switch software, and W0RLI 10.10 BBS software.

My problem is this: it seems that when I try to run the MBINIT.EXE file
my computer locks up.   My AUTOEXEC file contains the commands to load
LM, SHARE, CHKDSK, and the BPQCODE (for the G8BPQ switch). Once all of
this is loaded MBINIT locks up the system. I have tried repeating this
procedure with and without TNCTSR-S in memory and no difference occurs.

My configuration lines in CONFIG.MB (for RLI) are as follows:

```
PORT L C
RECENT CONNECTS
R               600     600     3600    1000    0       23      100   5

PORT A NODE
145.01 Mhz Packet Switch
RIGMUD123       600     600      180      50    1       23      5     5

PORT B NODE
145.01 Mhz Packet Switch
RIGMUD23        600     600     180       50    1       23      5     5

PORT C NODE
145.01 Mhz Packet Switch
RIGMUD23        600     600     180       50    1       23      5     5
```

My configuration in G8BPQ is as follows:

```
TNCPORTLIST=1,2,3,4

PORTS:

145.01 Mhz 1200 Baud (DRSI)
DRSI,300H,2,1200,A,BBSOK   ; DRSI board, 300H I/O address, IRQ 2,
                             1200 baud, Channel A,  BBS_OK here
192,2,300,100,255,0,0,5000,1000,10,120
;QUALITY, WINDOW, TX DELAY (@ 10MS INCREMENTS), SLOTTIME, PERSIST, FULL DUP,
;SOFTDCD, FRACK, RESPTIME, RETRIES, PACLEN,  CWID = N5LKM
```

I am about to pull all of my hair out because I can't find the problem.
I am missing it and I hope someone out there can find it... or I will
pull out all of my hair and it took 2 years to grow it back!

Any ideas, suggestions, observations, or comments are gladly welcomed.

Thank you for your time and interest.

```

I am interested in hearing comments from hams who have used an Icom IC-275
for packet radio.

1. Was the setup/hookup very easy?

2. Did it require funny connectors or wiring?

3. Did the levels match up very well?

4. How well did the IC-275 perform for packet?

Thanks. 73's from KA9WGN

Hello OM,

I hope this message reaches destination, as the routing-tables appear not to
be updated recently on our SURF-node...

Someone ever forwarded a message concerning the KA9Q program (and mods) to me,
so this made me wonder if there was a way to register for all these kinds of
bulletins. I am using the KA9Q package on my 2 Macintoshes, and made a number
of 'bug-fixes' for the program. I'd like to share the information with other
users, that's why I am lokking for a way to do this.

Regards,
Adam PA2AGA/PI8MAC.

Howdy....

I am having difficulty running the G8BPQ software under RLI 10.10. If I turn on MTX I can see transmitted packets going to my MFJ1270B 1.6.1, but the TNC will hold the packets for up to 5 seconds before transmitting them. The TNC is, of course, running in KISS mode. So if a user tries to connect to the BBS or NODE, he may send five connects which will be followed by five responses from the computer, but the TNC ends up holding them and transmitting them all at once some time later. I suspect a problem in the TNC software like a poor choice of PERSIST or SLOTTIME, but I have no control over those parameters from G8BPQ. The software runs better on my KPC-2 (I am assuming the default for these parameters are better suited to my particular application)

What I'm looking for is something like: Information that a new version of G8BPQ is out that sets these software parameters from the computer for me (I am running 3.20); some kind of quick fix C/BASIC program or something I can compile and run in my startup that will pre-load the values for me; some insight which demonstrates my misunderstanding of the problem and a new way of correcting it. If needed I can enclose a copy of my current parameters in G8BPQ, but I feel that the problem has been traced to the TNC, rendering these parameter values irrelevant.

73/Stephen Hicks

I have been encountering RFI while checking out some HF packet.

I just found where my RFI problem is. The cable going to the Enhanced
Color Display (IBM's EGA monitor) is very noisy. I notice that it is
the old type; it doesn't have an RFI trap on the video cable near the
display adaptor. I really don't want to scrap the display and buy a new
one.

Does anyone know what is in those RFI traps? Are they just wrapping
the wires around ferrite beads? Or are they putting all the wires around
a toroid? Are the RFI traps for displays available separately? What
other things (bypass caps, etc) would be worth trying?

By the way, 10 meters has been booming in from South America. Check
out 28,100.8 kHz.

After reading article in August '89 "73 Amateur Radio" page 34
"Control Your Rig from a PC" my brother KA1PPG (without usenet access)
asked if its do-able on his rigs. I've read both manuals on his
ICOM IC-740 and IC-251. It seams not possible on the 740 since the
only leads that are come close are:

pin #   Description

11   Input for TRANSVERTER control. When 8 Volts DC applied, the
     set can operate with a transverter.

12   Output reference voltage for band switching
13** Output for external band switching

It seams do-able on his 251 because it has the following connections
on the ACC connector:

pin # Description

16 Control signal (DBC) input terminal for external control
17 NC
18 NC
19 Control signal (DV) output terminal for external control
20 Control signal (RT) input terminal for external control
21 Data signal (DB1) input/output terminal for external control
22 Data signal (DB2) input/output terminal for external control
23 Data signal (DB4) input/output terminal for external control
24 Data signal (DB8) input/output terminal for external control

Now the article mentions that some radios have an input and output
that are 5V rs232 signals but neither of these do.

So can someone explain (or point me in the right direction) how to use
pins 16-24.

PS I can easily make my brother a board like mine that uses an 8255 PPI
   chip for digital control, if thats whats needed.

Any TNC-2 clone (MFJ 1270B, Paccomm tiny and micropower, etc...) can be fitted
with a KISS-Only ROM using the bits included in TNC_TNC2.ARC of the KA9Q
distribution. This is the way I run my station.

There are similar bits for TNC-1 clones, and the VADCG/ASHBY boards.

>Which is the best interface for IBM PC-compatible machines? Should we
>use the Pac-Comm PC-100 (is it supported by KA9Q NET software yet?),
>or something else? Opinions, please!

The driver for the PC-100 has not, to my knowledge, ever been completed or
tested. For 56kb operation, KA9Q has written a high-speed driver for the DRSI
PCPA card, that works fairly well.

>As far as I recall, Mike Chepponis (K3MC) is working on a better
>interface. I wonder when that would become available? And when would
>the software support it?

This fall sometime. Negotiations are reportedly underway for commercial
production of the card. I am not free to provide any further details. The
PCPA card is a reasonable, if slow, alternative for the next 4-6 months.

>Another point of interest would be the possibility to link the system
>to other computers than IBM PC-line. Is it possible at all, apart from
>the old, painfully slow TNC's?

All you need is 56kb HDLC, with the ability to have the interface clocked by
the modems, assuming you plan to use the WA4DSY units. The Macintosh does not
bring out all the lines needed, but solutions are being investigated. For
other machines, you'll need to provide or locate an HDLC interface, write a
driver, or just use a TNC that's been modified.

Maybe this will help:

+---+
        HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

 I have placed a BBS system on-line that is mainly oriented towards the
Amateur Community (but there is other stuff on-line). As of now I have not
attempted to promote this system any place except in the amateur channels
(PACKET, USENET, & word of mouth), and will continue under this policy, as
I hope to keep it oriented toward amateur radio. The various software for
UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through
user support I hope to keep the latest and greatest ham software on-line.
Below is the information that is needed in order to access the BBS via
Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

 System Name: WB3FFV
 Login: bbs
 Number: (301)-335-0858 -- 1200 & 2400 (Non-MNP)
 Number: (301)-335-1955 -- 2400 (MNP), 9600 & 19200 (PEP)
 Data Settings: 8 Bits, NO Parity, 1 Stop Bit
 Times: 24hrs/365days (except for routine maintenance)
 Software: XBBS (UNIX/Xenix Multiuser BBS)
 IP Address: 44.60.0.1 {wb3ffv.ampr.org} [for FTP access on 145.550 mhz ONLY]
 Misc. Info: Machine is an 80386 computer running UNIX V.3 and features 300+
             meg of on-line storage. Most transfer protocols are available!!

I think you may be mistaken about this - it sounds very much like this IS a problem with parameter values. When you see a monitored outgoing frame on the screen, it is going to the "virtual" TNC (i.e., the G8BPQ code), not to the actual TNC. I'm also using G8BPQ 3.20 with KISS TNCs (and MBL 5.12) and do not experience the problem you describe, so it is not an inherent problem with that version. I do hope that a version will be forthcoming soon which will permit changing TXDELAY, PERSIST, and SLOTTIME in the KISS driver. The TXDELAY in particular is far too long for my application.

I suspect you have a problem with one of the parameters other than the 3 just mentioned. Check your parameter list for your KISS port, paying particular attention to the value of RESPTIME. This should be the 9th parameter in the list - if there is one missing before it, RESPTIME would actually be set to the value intended for FRACK. Since the latter is nominally 5 seconds, this could explain your 5 second delay before keying up. Good luck!

By the way, if you have users who are actually sending 5 connect attempts in 5 seconds, you'd better tell them to smarten up - *their* FRACK is way too low!

Hi- I was hoping that some one could provide me with some beginner
info on packet radio.

I know a little bit about packet radio and think I might be interested
in getting involved with it but need some more info. I really do not
know very much about amateur radio so responses should explain things
in a manner that a neophyte can understand. I do have plenty of
experience with tcp/ip and local/wide area networks so you don't have
to go too far in depth about tcp/ip although I am at a loss to know
how packet radio handles routing (does anyone run gated over packet
radio? Is there an official "core" to the packet net?).

Sorry if all of this has been asked before. Feel free to answer here
or send email- whichever you feel is more appropriate.

I would like info about the following:

1) What sort of license is required? I have heard someone mention that
the FCC is considering eliminating the Morse Code requirement for a
license- is this true? What would I need to do to get a license?

2) What sort of data speeds are possible? I was under the impression
that 300/1200 bps was the max speed but I have heard folks mention
56kb speeds.

3) What is the range of a typical transmitter? I am thinking of

linking two sites with packet radio instead of slip or some other
PTP over telephone.

4) How extensive is the packet bacbone? Would I be able to send
data across Maryland? The east coast? Coast to coast?

5) What sort of equipment do I need. I could use a description of all
the hardware from the serial port of my machine to the destination
computer's serial port.

thanks all,

I have this package and have not been able to get it compiled under SCO Xenix
or IBM Xenix either. Has anyone been successful in getting it compiled using
the UNIX switches?

I am not sure I am reaching the NET. Can someone please reply so I know I'm
not just talking to my modem..

73 - Rick

ICOM makes a board to covert from parrallel to serial for the older
ICOM equipment. Try AES or HRO (I can't remember the part number off
the top of my head) I believe it is about $25.00 at discount.

I've read bits and pieces here and there about DRSI's stuff, but never anything
definitive.

Will the DRSI card described above, using the software described above, operate
under Xenix 2.2.3 (286)? Where can I get literature, etc.?

I'm thinking of getting back into packet, probably using TCP/IP. Is this the
way to go? Opinions, please (hopefully from someone who is DOING it).

Thanks & 73

Several months ago I went on a concerted campaign to quiet the monitor
I use with my AT. This is a vanilla monochrome monitor, but I think the
techniques used have general applicability.

1. Find the power supply line between the main circuit board and the
video driver board at the base of the CRT. Replace it with shielded coax,
grounding the shields as appropriate, and bypass the supply line on the
driver board end. I discovered that this wire was a significant radiator
of RF energy since the video driver board generates a pretty high level
signal.

2. Coat the inside of the cabinet with conductive paint. I used GC Nickel
Print; a single bottle was just enough. (Do this only if the cabinet is
nonconductive, naturally).

3. Sacrifice an old piece of RG-8 coax by removing the outer jacket with
a utility knife and slide out the inner conductor and dielectric.
Use the braid as an outer shield on the video drive cable from your
computer. Be sure to use conductive shells on the connector, and make
sure the braid makes good contact with the connector shell and with the
paint you applied to the inside of the cabinet.

I found these steps were successful in almost completely eliminating RFI
on the HF bands from my generic Taiwanese PC monitor.

Phil

> >   ...
You need at least a Novice class Amateur Radio license to operate packet
on 222 MHz, at least a Technician class to operate on 144 MHz and a
General class license to operate packet on HF bands.
> >   2) What sort of data speeds are possible? I was under the impression
> >   ...
Most HF packet is at 300 baud, most 144 MHz packet is at 1200 baud but
many people are experimenting with speeds of 2400, 4800 and 9600 baud.
There is some 56KB stuff going on in the higher bands, but that is
usually done by clubs and packet groups, not individuals.

> >   3) What is the range of a typical transmitter? I am thinking of
> >   ...
On VHF you can go as far as 100 miles depending on your terrain. HF is
limited only by propogation, and you can contact stations in countries
all over the world.
With packet, you can repeat through other stations (called digipeating)
and increase your range on VHF; a form of networking exists which can
allow you to make contact with people in other states.

> >   4) How extensive is the packet bacbone? Would I be able to send
> >   ...
This really depends on what part of the country you live in. You can
send messages via bulletin boards to virtually the entire country, but
live QSOs have more limited range on VHF.
> >   5) What sort of equipment do I need. I could use a description of all
> >   ...
I will only give a brief description here. You need a VHF or HF
transmitter, a terminal node controller and a terminal or computer (a
computer really works better since you can store messages for later
use). If you want to put together a 144 MHz packet station you can
probably do it for less than $250 if you have a computer already.

I would love to receive this information also. This is not the first time someone has made pretty much the same request. Will one of you knowledgeable and articulate packet radio folks please write up a summary of these seemingly elementary but elusive facts? It would be greatly appreciated.

thanks,
jim

Gateway: The ARRL Packet Radio Newsletter

Stan Horzepa, WA1LOU, Editor

Volume 5, Number 22 July 28, 1989

ARRL COMPUTER NETWORKING CONFERENCE COMING SOON

The 8th ARRL Computer Networking Conference will be held in Colorado Springs, Colorado, at the Air Force Academy in the Fairchild Hall conference area on Saturday, October 7. This year's hosts are Tucson Amateur Packet Radio (TAPR), Academy Amateur Radio Club, USAFA Cadet Radio Club, Rocky Mountain Packet Radio Association (RMPRA) and the ARRL. If you plan on presenting a paper, please contact Lori Weinberg at ARRL headquarters for an author's package. Deadline for receipt of camera-ready papers is August 28.

The Saturday session at the Academy will include prominent amateurs who are doing packet-radio development work at the leading edge of technology. They'll be speaking about the current efforts in the areas of packet-radio satellites, networking (ROSE, TCP/IP, TexNet), the new version of AX.25, digital signal processing, high speed packet radio, new packet-radio hardware and software developments and many other fascinating development efforts now in progress.

On Saturday evening (6:30-10:00 PM), there will be an opportunity to get acquainted at a special (and informal) attitude adjustment session at the

conference hotel (the new Colorado Springs Marriott). A full- size taco buffet ($2 per pass through the buffet) and cash bar will be available.

There will boncurrent sessions at the conference hotel on Sunday. The ARRL Digital Committee will be in open session and amateurs are welcome to sit in. At the same time, RMPRA will be hosting their annual Packetfest in a separate meeting room. The RMPRA Packetfest will feature many of the prominent amateurs in attendance for the Networking Conference and Digital Committee meeting. The Sunday session will be of the tutorial/discussion/ question and answer type of presentation.

Conference headquarters will be the new Colorado Springs Marriott. Reservations should be made by September 6. When calling for reservations, call the Marriott direct at 719-260-1800 (do not use the Marriott 800 number). Be sure to identify yourself as a member of the "ARRL Networking Conference."

Other nearby motels:

	Telephone
Comfort Inn	719-598-6700
Sheraton Inn	719-598-5770
Drury Inn	719-598-2500

Colorado Springs Municipal Airport is approximately 10 miles from the Marriott. It is served by six national carriers with over 100 flights daily from six major gateway cities: Chicago, St. Louis, Dalas/Ft. Worth, Phoenix, Salt Lake City and Denver. Airport transportation to and from the airport will be provided by the Marriott. Arrival and departure times should be coordinated with the hotel transportation staff.

For those arriving before 3 PM on Friday, October 6, a conducted tour of the Air Force Academy has been planned. The assembly point for this tour will be announced in a later bulletin and will be posted at the hotel registration desk. Private transportation will be used. If you need a ride, letyour needs be known when sending in your registration fee.

Registration for the conference includes the conference, one copy of the 8th ARRL Computer Networking Conference proceedings, refreshments throughout the day, lunch at the AFA Officers Club (transportation will be provided) and use of the Marriott hospitality room. There will be no charge for the tour of the Air Force Academy. Extra copies of the conference proceedings will be available.

Upon receipt of your registration, you will be mailed a preprinted Marriott reservation form and other matrials of interest. Please indicate if you would like to be included in the Air Force Academy tour. For further information send SASE with your name, call sign, address and telephone number to:

Andy Freeborn, N0CCZ
522 Borrego Dr

Colorado Springs, CO 80918
Telephone 719-598-8373

Or you may contact Lori Weinberg, ARRL, telephone 203-666-1541, FAX 203-665-7531

ROSE GROWS

Version 060289 of the ROSE X.25 Packet Switch release of 2 June 1989 is now on the following systems: PacComm BBS at 813-874-3078 (file area #1), K4NGC BBS at 703-680-5970 (file area #17). This version fixes the LOADER (it would lose memory space if you disconnected while uploading an application) and adds a file operation to CONFIGUR.EXE.

Network Status Report

The following report was filed by Bob Nelson, KB1BD, concerning the status of ROSE in the New York-New Jersey Metropolitan Area.

Many of us have spent a considerable number of hours working on the network this spring, fixing bugs, improving RF paths, etc. We are now adding additional paths to the network for your packet-radio pleasure.

I know some of you have had a bit of bad luck trying out some of this new equipment. Like all beta tests, there are quirks, however, after watching the code for the last three weeks, it appears that the bugs that were nipping at our heels all spring have met their fate... that was brought to them by the exterminator Tom Moulton, W2VY. The code in all modes appears to be very stable, therefore, I ask you to try what you have so far and, hopefully, find some enjoyment in its use.

From the KA2VLP-3 switch, that most of you use to connect to this station, the following direct PBBS paths from the ROSE network are available. The connect commands needed to use these PBBSs follow. Please use the ROSE path to minimize retries on the channel.

```
C KB1BD-4 V KA2VLP-3,609426
C KD6TH-4 V KA2VLP-3,201744 or
C KD6TH-4 V KA2VLP-3,212456
C WB2GTX-4 V KA2VLP-3,201744
C WA2VXT-4 V KA2VLP-3,609426
```

If you are using a TNC that uses the old TNC 1 firmware, substitute the second number in the all number fields with either an "o" or an "i" depending on whether it is a 0 or 1, for example:

```
C KD6TH-4 V KA2VLP-3,2o1744 or
C KD6TH-4 V KA2VLP-3,2i2456
```

There are other ports ed by these PBBSs for mail-forwarding which have been trunked, for the most part, off of the user channels. This trunking

is occurring via ROSE switches on UHF.

User access ports to the ROSE network are now available at the following sites:

	Call Sign	Address	Frequency	Location
	N2DSY-3	201744	145.07 MHz	Little Falls, NJ
*	N2ELC-3	201663	145.09 MHz	Lake Hopatcong, NJ
	KA2VLP-3	609426	145.07 MHz	Hightstown, NJ
	N2EVW-7	609530	221.01 MHz	Trenton, NJ
	KD6TH-6	212456	145.07 MHz	New York City, NY
*	N2EVW-8	609883	221.11 MHz	Trenton, NJ
	WA3YRI-3	609261	145.07 MHz	Mt Holly, NJ

* Under construction at time of this writing; may not yet be available for use.

KD6TH-3 on 221.11 MHz in New York City will be converting from its standard digipeater configuration to a ROSE switch very shortly .

If you would like to contact someone who has access to any of these switches, invoke the following:

```
C W2XXX-Y V N2VVV-T,609426
```

where W2XXX-Y is your call sign and SSID and N2VVV-T is the switch call sign and SSID that the other person can access.

Access to NET/ROM is also available. We are currently accessing it on 221.01 MHz and the channel is very crowded. Access to other frequencies is currently in the works, but until they are available, I offer the following suggestions.

To access the NET/ROM network, use the following connect sequence:

```
C WB2DRD-3 V KA2VLP-3,609530
```

The ROSE network will then set up a connection tothat station. Remember, although it says you are "connected" when using ROSE, you are only connected to the virtual circuit, which may actually be in the process of completing a connection.

After you make your connection and you know which node you wish to connect, enter the following:

```
C W3IWI-11
```

where W3IWI-11 is the target node.

If you are not sure which node to connect to, type:

```
NODES
```

To check if you are connected to a NET/ROM node, type:

INFO

If you have made your connection to WB2DRD-3 and type INFO, but do not get a response back in 30 or 40 seconds, disconnect and try later because the 220-MHz channel is probably too busy. If you do get a response back, feel free to connect to any of the stations that are accessible from the network.

To improve things, we will be expanding the ROSE network north and south. A Manhattan switch was added recently and a link to northwestern New Jersey should be up soon. We hope to have a site in southern New Jersey in the near future.

If you have friends that can access any of the netwrks outside of New Jersey, who wish to contact you here on 145.07 MHz, have them try and connect to the WB2DRD-3 NET/ROM node. If they can, then they should be able to connect to you here on 145.07 MHz. After they make a connection to WB2DRD-3, they must type:

C W2XXX-Y v N2EVW-7,609426

where W2XXX-Y is your call sign and SSID, N2EVW-7 is the ROSE switch that is on 221.01 MHz and 609426 is the ROSE address for the KA2VLP-3 ROSE switch (access of any ROSE switch on the network and the use of the address 609426 results in a connect attempt here on 145.07 MHz via the KA2VLP switch). Remember, the TNC 1 problem mentioned earlier.

from Andy Funk, KB7UV

BOSTON COMPUTER SOCIETY FORMS HAM RADIO SPECIAL INTEREST GROUP

The Boston Computer Society (BSC), the world's largest association of personal computer users, recently announced the establishment of an Amateur Radio Special Interest Group. The BCS Member Services Committee voted to establish the new ham radio group to tap the synergy existing between personal computing and Amateur Radio.

"The formation of this special interest group will bridge two distinct, but complimentary fields of interest," said Barry Porter, KB1PA, director of the Amateur Radio Special Interest Group. "It exposes personal computer users to ham radio, while allowing Amateur Radio operators to take advantage of the wealth of resources made available by the BCS, such as an abundance of technically competent members, an enthusiastic volunteer-based organization and extensive membership benefits."

Porter explained that applications for computers in ham radio include digital radio communication, network management, earth-based and satellite station control, video/FAX signal processing and a number of special-purpose applications, such as propagation prediction, satellite

tracking, record-keeping and telemetry.

The Special Interest Group was formed by a core group of BCS members after more than a year of planning and organization. Monthly meetings and a group newsletter cover such topics as packet radio, shortwave listening, amateur satellites and reception of high resolution weather satellite images.

The group's plans include several technology-related projects, both hardware- and software-based. In addition, an amateur Novice license class will be offered in the fall.

The Boston Computer Society is the world's largest personal computer user group with more than 31,000 members from every state and 57 countries worldwide. It is a nonprofit organization dedicated to educating people about the uses of personal computers. Founded in 1977, the BCS has its headquarters in Boston.

To join BCS and te Amateur Radio Special Interest Group, send an SASE to:

Amateur Radio Special Interest Group
The Boston Computer Society
One Center Plaza
Boston, MA 02108

For further information, call Barry Porter, KB1PA, at 617-341-2639 or 617-769-6000 extension 174, or Tom Walsh, KT1W, at 617-466-2392.

LOCAL PACKETEERS NEEDED TO HELP DISTRIBUTE BBS DATA

Howard Sargent, SYSOP of the SEL (Space Environment Laboratory) landline BS, is looking for assistance from local radio amateurs to help get bulletin-board information onto packet-radio nets. (The SEL BBS provides extensive propagation reports. See "NOAA's Space Environment Laboratory Public Computer Bulletin Board Service" in August QST.) Volunteers are needed to regularly download files from the SEL mainframe computer and assist in setting up methods to make the data available to as many amateurs as possible.

If you'd like to help and you live in the Denver area (where it's a local call to the 497 exchange in Boulder), give Howrd a call at 497-3697 to discuss possibilities or write to him at:

Space Environment Services Center
NOAA/ERL R/E/SE2
325 Broadway
Boulder, CO 80303.

From Compuserve, HAMNET section 9:

#: 104571 S9/Packet Radio
    02-Aug-89 19:56:51
Sb: TAPR office is back
Fm: ANDY FREEBORN N0CCZ 73177,1317
To: All

After a short period of down time at the TAPR office due to the early arrival of a baby girl to Cris, our office manager, we're now back in business as usual.

Heather, N7DZU, is answering the remoted phone calls and handling all of the office duties. The new supply of DCD mod kits have arrived and back orders are being filled as rapidly as possible.

Office hours continue to be from 1000 to 1500 Aizona time (which is the same as PDT) Tuesday through Friday. A recorder will be placed on line to take urgent messages during other hours. We're playing catch-up as quickly as we can for all unfilled requests.

We appreciate your patience and understanding.

Andy N0CCZ

Is this true? "What's Going on in the New Novice Bands" (QST, May
1987) seems to contradict this. In the section covering 28.1 to 28.5
MHz, it indicates that Novices have "new F1B (frequency shift keying, or
FSK) privileges from 28.1 to 28.3 kHz (sic); these privileges allow you
to use packet radio, AMTOR, and Baudot and ASCII RTTY."

Did anything later rescind this?

Hmm, you may be right about 10 meters (I thought it was voice and cw
only but I guess I was wrong). However, you need a General class
license to operate packet on any HF band besides 10 meters.

Thanks for the correction.

Gateway: The ARRL Packet Radio Newsletter   July 14, 1989

Volume 5, Number 21   Part 1 of 4

Stan Horzepa, WA1LOU, Editor

WASHINGTON FREQUENCY COORDINATOR ENDS PACKET RADIO COORDINATION

The Western Washington Amateur Relay Association (WWARA), the frequency coordinator for Western Washington, has terminated frequency coordination of packet-radio operations. At its April meeting, the membership of WWARA voted unanimously to approve a proposal that ends its packet-radio frequency coordination function (see "No Packet-Radio Coordination Proposed" i Gateway, Volume 5, Number 11). WWARA will retain the power to coordinate frequencies of packet-radio operations that wish to use a standard voice repeater frequency pair. After the proposal was accepted, WWARA terminated all of its previous packet- radio frequency coordinations and sent certified letters to the affected parties notifying them of the termination.

The WWARA membership also unanimously voted to recognize the Northwest Amateur Packet Radio Association (NAPRA) as the frequency coordinator of those paet-radio operations that are no longer under WWARA's jurisdiction.

from The Coordinator (WWARA's newsletter)

BROADCAST PROTOCOL PROPOSED FOR SATELLITES

Harold Price, NK6K, and Jeff Ward, G0/K8KA, have presented revision 4 of a proposal for a protocol to be used by the UoSAT-D Packet Communications Experiment and by the AMSAT-NA MicroSats. This protocol is meant to facilitate the transmission of data to large numbers of ground users and would supplement the standard AX.25 connected mode.

The designof the protocol is not yet final, nor is its particular implementation on the satellites. Allowing time for comments, a final version should be available in late July.

Comments on this proposal are welcome and encouraged. Address comments to HPRICE or UOSAT via Telemail, 71635,1174 via CompuServe, NK6K @ WB6YMH or G0K8KA @ GB2UP via packet radio.

[The proposal is available for downloading from Data Library 9 (DL9) on CompuServe's HamNet.]

AMSAT SPACE SYMPOSIUM RESCHEDULED

A conflit between the scheduled dates of the MicroSat/UoSAT launch and the AMSAT-NA Space Symposium have motivated AMSAT-NA officials to reschedule the Symposium to the weekend of November 3-5 (the MicroSat/UoSAT launch is now scheduled for November 10 and the Symposium had been originally scheduled for November 10-12). Since many key personnel for the satellite program will be delivering papers at the Symposium, it was felt that it would be impossible for them to be in two places at once. Therefore, to avoid ts conflict, the Symposium was rescheduled to one week earlier.

Everything else remains the same. The location of the Symposium is Des Moines, with registration on Friday, seminars on Saturday, the Annual AMSAT-NA Banquet on Saturday evening and the Board of Directors meeting on Sunday. With the launch of the MicroSats and UoSATs D and E, there will be many papers devoted to various aspects of these new satellites. For more information, contact AMSAT-NA at 301-589-6062 or Ralph Wallio, W0RPK, at 515-961-6406.

Volume 5, Number 21 Part 2 of 4

THE W0RLI INTERVIEW

Hank Oredson, W0RLI, is the author of the world-renowned W0RLI Mailbox software. In 1984, Hank wrote his mailbox software for the Xerox 820 computer, however, the limitations of that computer caused Hank to switch to the IBM PC (and its clones) where it now resides in PBBSs throughout the packet-radio world. Herb Sallis, WB1DSW, and other members of the New England Packet Radio Association (NEPRA) spent an afternoon discussing the state of the packet-radio art with Hnk while he was visiting Massachusetts. The following interview was written by Herb and published in NEPRA's newsletter, NEPRA PacketEar.

By the way, Hank recently released Version 10.08 of his mailbox software and it is available from the usual sources.

Q: How are things going on your side of the country in terms of the network your folks are putting together?

W0RLI: Not too well in my area actually. Northern California LAN frequencies are out of control. We have some real problems in terms of overall network speed versus the number of packet users on the air at any given time. Many of the network enhancements we looked forward to

from NET/ROM haven't come into being with hidden transmitters and faulty radios among the top problems.

Q: Is anyone doing anything about the situation?

W0RLI: I suppose just as in any network, we have some political hurdles to deal with. Mountaintops, while not scarce, are difficult to acquire because of the tremendous number of other services (ham and non-am) in use. Like many other networks, we have the "doers" and "users." The doers are so few in number that they can't get enough done fast enough, while the users do most of the complaining.

There are moves afoot to experiment with the new 9600-baud modems available from England. Some radios and modem kits are being prepared for testing, but right now I'm not exactly sure where all that is. Getting the network to move faster has to be an absolute priority.

Q: Describe briefly the size of the network at this time.

W0RLI: In my small area, there are 24 active NET/ROM nodes and approximately six active full-time mailbox systems. I have a hard time keeping track of the numbers out there beyond the valley I live in, but it seems as though we're sprouting new systems each day.

Hank quickly looked at a New England backbone map and commented: A lot has changed since I left. This looks impressive! Does it work? I would say that New England and the East Coast have a good looking network... much better than ours given the current state of affairs.

Q: How many of your mailbox systems are in operation today?

W0RLI: Worldwide? About 2000. That's a seat-of-the-pants guess. By the way, you can expect to see the first Russian mailbox systems appearing on the air within the next few weeks.

Q: Glastnost.

W0RLI: Indeed! I know there are over 350 mailboxes running now in Japan, too.

Q: That's a sizeable number. Are the Japanese netoorks different? Are they better, worse, the same?

W0RLI: Far superior I feel that the Japanese are doing their network the right way and the effort they have put into organization, control and implementation is paying off handsomely.

Q: Please tell us their secrets!!

W0RLI: First, they have assigned a Network Administrator for each of their sectors. He/she is given almost total reign in terms of setting up things like individual station parameters, NET/ROM and digipeater parameters, mailbox behaviors, frequency allotments, etc. If someone

doesn't play by the rules, that station is excluded from accessing mailboxes and is generally considered persona non grata until he/she changes his/her thinking.

Also, they have wisely allocated large chunks of frequency spectrum for packet use. They have carved out many channels on 2 meters with standard spacing. Further, they have allotted 200 channels in the 440 to 450-MHz range. Each block of 100 channels is spaced at least 100 kHz apart giving them the ultimate in flexibility later when faster speeds become widely available. The

Japanese really know how to organize. They multi-channel everything. They are also aggressively moving into the 1296-MHz range so that sites are available and in use for later upgrading.

Q: How do you come to know so much about Japan?

W0RLI: In February 1988, they had a giant organizing effort, a major conference, and I was invited to attend, all expenses paid. I gratefully attended and have kept abreast of affairs over there through

Gateway: The ARRL Packet Radio Newsletter July 14, 1989

Volume 5, Number 21 Part 3 of 4

THE W0RLI INTERVIEW (Continued)

Q: Very interesting. Speaking of "mailboxes," we've all seen the arrival of AA4RE's Multi-Connect BBS software recently. What can you tell us about it?

W0RLI: First off, I'm really not involved in that project as heavily as some people think. I do have a business to run and other things I like to do. From what I see, it looks and feels like a W0RLI system except that AA4RE uses the multi-connect capability of the newer TNCs.

From my perspective, we already have networks jammed with retries and crashes brought on by the nature of the AX.25 protocol. I don't think most people realize that, although their TNCs are set to 1200 baud on the RF port, the more stations you add to a channel, the worse things become in terms of congestion, and, as a result, your throughput rate is roughly divided by the number of stations that can be heard. Thus, 1200 baud is more like 50 baud on a busy channel crammed with retries and failures. Multi-connects from a BBS standpoint adds to the futility. The full weight of the system's multiple attempts to resend the same packets over and over as the approaching acknowledgements fail to satisfy the sending TNC, bring further doom upon a channel. This is why I, for one, have stayed away from doing anything of this sort. At 1200 baud, it will bring most networks to their knees!

By the way, I'm glad to hear you use the word "mailbox" instead of BBS. I have clled my program a mailbox from the very beginning.

Q: What will the next version of the mailbox look like?

W0RLI: I don't have any firm plans in mind. It does exactly what I think needs to be done at this time. On the other hand, I would say that my new task would be to incorporate some specific kinds of "server" functions to do specific tasks related to specific needs. And, of course, there are always those nifty little suggestions that come from just about everywhere, not to mention "bug" fixes.

Q: Speaking of new features, the round-table function came out in Version 9.01, but was not documented and caused some problems. What was the force behind it?

W0RLI: You know I listen to folks when they ask for things and I try to give due consideration where I feel it's necessary. The request for a round-table function came from an ARES group that pleaded desperately for a way to conduct a net-type operation. So, I stuck it in and they usd it once, maybe twice and went back to sending mail back and forth. I guess it wasn't as useful as they first thought! I may take it out if there's no need for it. My philosophy is that I consider memory to be at a premium, so I try to keep my code as tight, compact and short as possible.

Incidentally, let me comment on the lack of documentation. I can't do both.

The mailbox now supports passwords for remote SYSOPs. I did this at the request of some European mailbox operators who were bein plagued by "packet terrorists" bent on destroying their network. I know this feature is one that I'll probably keep.

Q: I quite agree. The code is so rich at this point that I frankly don't see how one single person could keep the documentation whole. Now, where do you see the future of packet radio going? Is TCP/IP going to take over?

W0RLI: The first question is an interesting one, one which I get asked all the time. My answer is that I'm not certain. We have lots of good aplications out there now just beginning to come to the fore. We need to move the network faster. We need some satellite links between major areas of the country and around the globe, more than what is available now. We need to educate users and SYSOPs alike. Twenty minutes ago, we looked at NM1D's DOSGate, a real slick tool that can be used for a variety of purposes. That's available now and I hope to see more of them spring up.

I also get many questions about TCP/IP nd what it's future is. My opinion is that it's nice, but it doesn't do anything more than the current systems can do. I know it is getting more play in this area now. I'm all for new things.

Q: It's been great seeing you again and getting your insights. All of us want to thank you for your tireless efforts in providing such a fine

system.

W0RLI: Thanks. I'll be back some day soon, I trust, and be able to make a NEPRA meeting!

Q: We all hope you'll be back soon. 73.

(For more information abouNEPRA, write to PO Box 208, East Kingston, NH 03827 or attend one of their monthly meetings on the second Thursday of each month, 7:30 PM at the Honeywell plant cafeteria in Billerica, MA.)

Volume 5, Number 21 Part 4 of 4

LAN-LINK

LAN-LINK is a packet-radio and AMTOR terminal program that runs on IBM PCs or clones and provides a window into the Local Area Network (LAN) for the AEA PK-232s, Kantronics KAMs, TNC 1s and TNC 2s. It uses menus and function keys to allow the user to communicate, rather than play with TNC parameters which he doesn't understand. Some of its features follow.

- Recognizes your call sign in a PBBS mail beacon, then automatically connects and downloads your messages.

- Automatically requests bulletins from the PBBS on subjects that interest you.

- Provides a conference mode for multiconnect situations.

- Provides split-screen operation for incoming and outgoing text, as well as for terminal status information.

- Alerts you when a predetermined call sign shows up in a packet header on frequency.

- Automatically captures to disk a recording of all connections. Indicates number of packet radio connections.

- Provdes "smart" packet mode printer control that turns off upon disconnection.

- Indicates that a specified station has connected while you were away.

- Automatically sets NET/ROM and KA-Node paths from its call/path file.

- Stores and forwards LAN messages.

- Automatically connects and downloads messages from other LAN-LINK stations.

o Determines paths to DX stations.

o Provides AMTOR/packet-radio MSO and Selective Automatic Answering Machine function that displays a message queue.

o Automatically configures TNC for HF and VHF packet-radiooperation.

o Calls CQ repetitively and alerts you when a reply is received.

o Provides RTTY SELCAL mode.

o Supports RTTY Navy MARS File Transfer Protocols (PK-232 only).

o Contest mode sends standard message and automatically increments QSO count.

o Provides single keystroke set-up to receive UoSAT-OSCAR 9 and Phase III RTTY telemetry (PK-232 only).

LAN-LINK is distributed as shareware, ie, the user can try the program and, if he wishes to keep it, he registers his copy by sending $35 to its author. Registration entitles the owner to upgrades and full support. Users of earlier versions of LAN-LINK and of PK3223COM Version 1.48 may upgrade by sending the author a blank, formatted diskette and SASE.

LAN-LINK is written, maintained and upgraded by Joe Kasser, G3ZCZ, POB 3419, Silver Spring, MD 20901, telephone 301-593-6236.

First, I appreciate the mail (and the call from Rick N7LDI) on how to get the FT727 to work on packet with the MFJ 1278. I first attempted the easiest method available (with the parts I happened to have available). That was to take the mike line through the capacitor, tie it to the ptt line, through a resistor to gnd. While I was able to key the transmitter I couldn't get any reply. After varying the capaciator and resistor all over the place with no results, I went with the suggestion from Bob Merritt N7JKV and used a small audio isolation transformer with a 10k pot (if anyone need a copy of the schematic just let me know) and I was up and running in no time flat.

Now, to the meat of my project. I'm off working on a multi connect bulletin board system that will eventually allow both ax.25 AND tcp/ip connection. The AX.25 is working, but many features still need to be added before I begin alpha/beta testing and then finally release to the world. I assume that the W0RLI BBS is pretty much the standard system in place today (correct me if I'm wrong).
If anyone has any features that they like about BBS's or ones that they WOULD like to see in future BBS's I have an open ear.

Hi, Im in the process of debugging an HDLC driver for the KA9Q sfw
package. Does anyone know of any other HDLC driver avalable for this
software? I am using the MITEL ISDN card plugged into a IBM AT. If
anyone knows of anyone else using this board with the ka9q sfw, plz
let me know so i can talk to someone about a few strangenesses ive
encountered. Thanks.

Can someone please tell me simply what is required for a cross-band
gateway without twenty miles of dissertation on NET, NETROM, etc?

All I want is the simplest/cheapest/easiest way to get some of our local novices, now on 220, to the two-meter system. Do I need two TNCs? If so, how do I hook them together? Is there one unit that will do? Anyone have personal experience in doing this?

Again, no long stuff on TCP/IP, NET, etc, just simple. We have lots of new novices, some who have run right out and bought shiny new 220 rigs, only to have almost no one to talk to. If I can get a gateway of some type so they can access the BBSs, etc on two-meters packet, we may be able to keep them in the hobby.

Please E-mail, as I don't always get to read the newsgroup.

Thanks and 73,

Michael

Andy asked me to post this... **PLEASE** register if you're planning to be

here... it's important that we have some idea of how many folks are planning to attend!

73 - Bdale, N3EUA

The 8th ARRL Computer Networking Conference (read PACKET RADIO) will be held in Colorado Springs on the 7th and 8th of October 1989.

If you plan on presenting a paper, please contact Lori Weinberg at ARRL headquarters for an authors's package. Deadline for receipt of camera-ready papers is August 28.

On Saturday Oct. 7th the speakers will be presenting their papers describing the latest in packet radio digital, RF, networking and satellite developments. This session will be held in conference facilities at the Air Force Academy. Hosts will be TAPR, AFA ARC, AFA Cadet ARC, RMPRA & ARRL. On Saturday eve there will be an attitude adjustment hour at the Marriott.

On Sunday Oct. 8th the ARRL Digital Committee will meet in open session at the new Colorado Springs Marriott.

Also on Sunday the Rocky Mountain Packet Radio Association will host their annual Packetfest at the Marriott. This years Packetfest will feature speakers in attendance for the conference. The RMPRA session will consist of tutorial/discussion/Q&A presentations as well as demonstrations.

Conference headquarters (and hospitality room) will be at the Colorado Springs Marriott. Special conference rates are: Single room, $45; extra person in room, $13. Reservations must be made by September 6th. After this date there is no assurance that space or the special rate will be available. When calling for reservations, call the Marriott direct at (719) 260-1800 (do not use the Marriott 800 number). To get the special rate be sure to identify yourself as a member of the "ARRL Networking Conference".

A conducted tour of the Air Force Academy is planned for those arriving before 3PM on Friday, October 6th. Private transportation will be used so please indicate your interest in this tour when sending in your registration. There will be no charge for the tour.

Special activities for those ladies accompanying their ham spouses are being arranged for Saturday. Drop a note to Karen Garbee, N1FED, 4390 Darr Circle, Colorado Springs, CO, 80908 to get the details. Karen can also be reached at (719) 495-0091, Compuserve 76430,3323, or karen%winfree.uucp@ucsd.edu.

Registration for the conference is $20.00. This fee includes the conference, one bound copy of the 8th Networking Conference papers, refreshments throughout the day of the conference, lunch at the AFA Officers Club (transportation will be provided) and use of the Marriott hospitality room. Extra copies of the bound conference papers will be available for $12.00 each.

IMPORTANT ******** IMPORTANT ******** IMPORTANT

In order that suitable arrangement are made to accomodate all in attendance it is important that you register before October 2nd. Send your $20 registration fee (make checks payable to Andy Freeborn), along with your name, call, address and telephone number to:

Andy Freeborn, N0CCZ, President TAPR
5222 Borrego Drive
Colorado Springs, CO 80918

Where could I get a copy of this? I haven't been able to get it running either.
I get a compile error (will write it down if that would help), and can't get
past that point.

Recently I put out a letter, in which I asked how to subscribe for KA9Q
and other hamradio bulletins...

It appeared, that the reply-address is always wrong on top of my letters,
so here is the right one: gaalen@hdetno51.BITNET

I hope this will do better, and still hope to hear from you!

Hallo everyone. I hav a single-card computer running without OS
It is built of a M-6809 CPU, SY-6522 paralell and timer, m-6850 serial
and a ROM-monitor that can recieve S1-records for loading programs.

I wonder if anyone has some sort of source-code (for 6809,6801 or sim)
that makes this act like a packet-modem (with AM7910 modem-chip)

I have the Aug 89 release of NOS and I have a few questions.

I have created \DOMAIN.TXT but nos always erases it when I exit the program.
Is nos suppose to create the file itself? How do I enter ip addresses for
people that I already know if I don't use domain.txt.

Has ftpusers changed its format?

ve3pzr password \ 7   no longer works when I connect to myself.
I can login but get permission denied on every command.

Is there a manual that describes nos? I have the older net.exe manual from
May 89.

No, nos never erases /domain.txt. Check to make sure your MS-DOS "FILES"
parameter in config.sys is sufficiently large.

Yes. The backslashes should be changed to forward slashes; I wanted to
standardize the format across all ports of the code.

>Is there a manual that describes nos? I have the older net.exe manual from
>May 89.

Not yet. One of these days...

Hello NETters,
In response of the many requests for Rob - PE1CLH's version of net
Here It Is...
Where???? well I planted the bits on flash.bellcore.com for ftp access
in /pub/chlnet and for uucp acces/ bbs access the files are on
wb3ffv / gvdgpc in a directory CHLNET.

I am playing with an archive-request server BUT don't wat to take the
(enourmous) cost of the phone bill to send out the Mb's of files to each
one.. If you want them , pick them up (at your expences!!!!).

Here is the REAME file from Rob.

This set of files is the latest (14 August 1989) release of my NET version.
It contains all the features previously described on tcp-group, and is
available in PC and Atari ST versions.

Files:

890814m.arc	executable compiled using MSC 5.1. Supports COM ports via MBBIOS or FOSSIL, and has the SCC driver. (Z8530)
890814l.arc	Same, but compiled in LARGE model. This removes the 31K limit on heap space, but it makes the program larger.
890814az.arc	executable compiled using Aztec C 4.10d. Contains drivers for 3c500 and packet, in addition to COM and SCC.
890814st.arc	executable for Atari ST, compiled using Mark Williams C.
net_doc.arc	a collection of documents, partly in Atari "first word" format (but plain text version of these is also included). It is not much, not really up-to-date, but at least read it before you complain about this.
netcom.arc	a utility needed when using the TNC2 emulator under DoubleDOS

Can Anyone Help:
I am new to digital communications ... and Packett radio. I would like to buy a Multi Mode TNC that will do Packett, AMTOR, RTTY, CW, and WX Fax. After looking around I can see that their are 3 Boxes that will fit my bill. That is the AEA PK-232, the Klantronics KAM, and an offering by MFJ. Can anyone comment on any of these TNC's. Which has the most friendly software ? Which has the most features ? How important is the "DUAL-PORT" feature in the KAM box. I will be using this TNC with a Kenwood TS-440s and a Kenwood TM-221a 2-meter mobile rig in the shack ... are any of these boxes better suited for the Kenwood line ? I also will be using a AT-Clone with a 30meg hard drive.

Also, can anyone suggest a good book to help me with Packett and digital communications.

If you will respond to me directly I will summerize and post.
Thanks in advance.

RUDAK-2 TO FLY NEXT YEAR

During a meeting between AMSAT-DL officials and a representative of ORBITA, the Soviet Amateur Radio Satellite Organization, at the RSGB/AMSAT-UK DATASPACE '89 (the combined space and digital communications symposium held July 27-31 at the University of Surrey), a tentative agreement was reached to fly a RUDAK transponder aboard RS-14. RUDAK is a German acronym that stands for Regenerating Transponder for Digital Amateur Communications. Many will remember that the RUDAK experiment, which flew on AO-13, failed to realize its full potential because a temperature-sensitive PROM would not allow the RUDAK computer to "boot-up" properly. Despite many intensive efforts to work around this problem, it was not possible to solve it. But characteristic of the indomitable spirit of the RUDAK group within the AMSAT-DL organization, there will soon be a new and improved version of this digital experiment to be known as RUDAK-2, which will be part of the RS-14, a new Mode B satellite. RS-14 will be flying aboard the Soviet's geological survey satellite known as GEOS, (not to be confused with the United States weather satellites known as GOES) in the now-familiar "piggyback" configuration first seen with RS- 10/11.

There are several important differences between RUDAK-2 and its predecessor on AO-13. The biggest difference is that the AX.25 amateur packet-radio protocol will be incorporated into the software, which means that digipeating will be possible. Also, a limited mailbox capability will be prese. Using the Manchester encoding technique and binary PSK modulation, the RUDAK-2 transponder mode will operate in Mode B. It will have two separate receive channels for different signaling rates: Channel #1 for 1200 baud at 435.100 MHz and Channel #2 for 4800 bauds at 435.150 MHz. The downlink frequency on 2 meters will be 145.990 MHz. The nominal

RF output of the 2-meter downlink transmitter will be 2 watts, however, it can be commanded by a ground station to a higher RF output of 12 watts.

The delivery of the RUDAK-2 transponder is scheduled to occur on December 15, so it can be integrated into RS-14 for a mid-1990 launch.

from AMSAT News Service

HF PACKET-RADIO INITIATIVE

"The Great 1989 HF Packet Design Quest" article in May QST announced a new initiative to stimulate amateur development of more effective HF packet-radio transmission systems. (If you are interested and haven't seen the article, get hold of May QST.)

ARRL headquarters has completed several bibliographies of works on channel characteristics, modems, protocols and digital signal-processing. Bibliographies have been mailed to people who have expressed an interest and will be asking prospective participants for resumes and some information on what they would like to contribute to the project.

There will be an opportunity for reimbursement for certain out-of-pocket expenses for participants ultimately chosen by the ARRL Digital Committee.

If you would like to be added to the mailing list, write or call Lori Weinberg at ARRL HQ.

NOVICE NOTCH - OPINION: A PACKET-RADIO DISGRACE

In many areas, Novice packet-radio growth has been slow to nonexistent. The reason is the lack of support from some of the packet-radio community. VHF packet radio is very limited for Novices, especially when local packeteers decide to operate outside the Novice subbands on 220 MHz. We should be encouraging new hams in this mode, not excluding them. Many Novices buy TNCs only to find the action is just beyond their reach. Lets get together to welcome these newcomers to our mode and make packet radio easily accessible for them. If you operate outside the Novice frequencies on 220 MHz, consider this: The more people that actively use the band, the harder it will be to take the rest of it away.

from Lou Scalpati, N2JLS

APLINK USED FOR ARMENIAN EARTHQUAKE HEALTH AND WELFARE

The cover story of the August 6 Cleveland Plain Dealer Sunday magazine section described the efforts of Ohio amateurs to get health and welfee traffic in and out of earthquake-striken Armenia in December 1988. The main thrust of the effort was to transfer lists of names from concerned relatives in the United States to Armenia to learn of their welfare. This involved the use of packet radio and AMTOR between the US and Great Britain, which was the relay point between the US and Armenia. Traffic to the relay station operated by G4SCA, was sent using packet radio and traffic back to the States was sent using AMTOR. To accomplish this

mixed-mode transfer, Vic Poor's, W5SMM, APLink software was used.

NETWORKING CONFERENCE REMINDER

Those of you who are planning to attend the 8th ARRL Computer Networking Conference in Colorado Springs, October 7-8, are reminded that the deadline for registration is October 2. For further information send SASE with your name, call sign, address and telephone number to:

Andy Freeborn, N0CCZ
5222 Borrego Dr
Colorado Springs, CO 80918
Telephone 719-598-8373

ARES/DATA VERSION 1.0 NOW AVAILABLE

ARES/Data, the long-awaited enhanced version of ARES/Data, is now available. ARES/Data is a multiconnect, multiport generalized database accessible via packet radio that also includes a full-featured conference bridge. The program is intended for use in a wide variety of emergency and public service Amateur Radio situations. (For a paper on Version 0.1 of the software, see the Proceedings of the 7th ARRL Computer Networking Conference.)

New features added to Version 1.0 (beyond 0.1) include:

o multiple ports (up to four with 8 to 32 simultaneous connects each),

o support for DRSI PC*PA packet-radio adapters,

o enhanced configuration file-processing with start-up files for each TNC,

o update of selected field in a record,

o import/export facility,

o list range instead of list all,

o beacon facility,

o download file facility from a public directory,

o labels command, including a label for the message field,

o separate paths for database, index files, public directory,

o many enhancements for the SYSOP screen, and

o improved error-handling of disk full and disk errors.

The key idea behind ARES/Data is that it allows you to track any type of information as needed that can be organized as four 20-character fields plus an 80-character message for each record.

Possible uses:

o track victims of a multiple casualty incident sent to hospitals,

o track ham manpower availability/assignments,

o record evacuees and shelter enrollment,

o track floats in a parade,

o short-message database: Field1=To, Field2=From, Msg=80-character message,

o house-by-house damage assessment, and

o DX-spotting.

ARES/Data was written by Weo Moerner, WN6I, and Dave Palmer, N6KL, with the ideas and support of a committee of hams from the Santa Clara County Amateur Radio Emergency Service. It is a copyrighted, public domain program, available without charge to anyone interested. The program was written on the authors' own time and equipment and the authors have their employers' permission to contribute the program to the public domain.

ARES/Data runs on an IBM PC of most any type (or equivalent) using DOS 3.2 or later with at least 400 kbytes of memory. To use the program via packet radio, the SYSOP needs at least a DRSI PC*PA packet-radio adapter or a serial port and a TNC with the Ron Raikes, WA8DED, firmware installed, such as a TNC 2, TNC 1, AEA PK-87 or AEA PK-88. The user's TNCs may be of any type.

ARES/Data may be downloaded from CompuServe's HamNet or you may obtain the program by sending a blank disk (5-1/4-inch 360-kbyte or 3-1/2-inch 720-kbyte) to:

     Weo Moerner
     1003 Belder Dr
     San Jose, CA 95120

Please feel free to distribute the program by whatever means you like. We hope ARES/Data will prove useful to other Amateur Radio groups as they help fulfill the emergency communications needs of their communities. We invite your comments and questions!

from Dave Palmer, N6KL @ KB6OWT and Weo Moerner, WN6I @ KB6OWT

NEW W0RLI MAILBOX AND MSYS PBBS VERSIONS AVAILABLE

Version 10.12 of the W0RLI Mailbox software is now available as is Version 1.5 of the WA8BXN MSYS PBBS software. To obtain a copy of MSYS, Canadians may send one 5-1/4-inch, 360-kbyte disk and a self-addressed, postage-paid, disk mailer to:

J.B. Weazle McCreath, VE3EAR
108 Montcalm St
Goderich, ON N7A 1W1

The W0RLI and/or the MSYS software may also be downloaded from CompuServe's HamNet and VE3GYQ's landline BBS at 519-660-1442 using 2400/1200/300 bauds with 8 character bits, no parity and 1 stop bit.

NORTHEAST TCP/IP MEETING SCHEDULED

The second meeting of the northeast region amateur packet-radio TCP/IPers is scheduled for Saturday, September 23 at ARRL Headquarters in Newington, Connecticut. All those interested in TCP/IP via amateur packet radio are welcome to attend.

A proposed agenda follows. Anyone with additions or changes, please send a message to ke3z@ke3z.ampr.org or to KE3Z @ W1AW. If you will need any audiovisual equipment, please let KE3Z know no later than September 18.

Tentative Agenda:

1. Opening remarks and Introductions by KE3Z.

2. Network status reports and current plans for Connecticut, Long Island, Massachusetts, Maine, Rhode Island and New York.

3. Network round table: how to improve the network throughput.

4. The New England TCPer newsletter status report by Rich Vitello, WA1EQU.

5. Open forum.

6. Summary and list of action items.

from Jon Bloom, KE3Z

GATEWAY ACCESSIBLE VIA INTERNET

Internet may now be used to submit stories for publication in Gateway or to send electronic mail to your Gateway editor. The only limitations are that

the files must be in ASCII format and must not exceed 50,000 characters in length. The address for sending Internet electronic mail to Gateway is:

70645.247@compuserve.com

Internet access to Gateway is being accomplished via a gateway between CompuServe and Internet. Any CompuServe user is accessible via this gateway. To address electronic mail to a CompuServe user via Internet, replace the comma (,) in the CompuServe user ID with a period (.) and append @compuserve.com to the modified user ID. (My CompuServe user ID of 70645,247 becomes 70645.247@compuserve.com after it is modified for Internet.)

The Internet-CompuServe gateway also permits CompuServe users to send electronic mail to Internet users via CompuServe's EasyPlex. To address electronic mail to an Internet user via CompuServe, you simply prefix the user's Internet identification with >INTERNET: (for example, Internet identification yaz@leftfield becomes >INTERNET: yaz@leftfield after it is modified for CompuServe's EasyPlex.) There is no extra fee charged by CompuServe for use of this gateway.

Besides Internet, electronic submissions and mail for Gateway may be made directly via CompuServe to user ID 70645,247 or via telephone (your editor can be reached on evenings and weekends at 203-879-1348 and he can switch a modem on line to receive text at 300, 1200 or 2400 bit/s).

Submissions via he US mail should be sent to 75 Kreger Dr, Wolcott, CT 06716-2702. Also, personal messages may be sent to your Gateway editor via packet radio to: WA1LOU @ W1AW.

Thanks to Bruce Hale, KB1MW and David Dodell, WB7TPY for some of this information.

AMSAT CALL FOR PAPERS

AMSAT NA is soliciting papers for presentation at and/or publication in the proceedings of its 1989 Space Symposium. Areas of interest include research, development, engineering, funding, construction, management and operatin of OSCAR (Orbiting Satellite Carrying Amateur Radio) communications and scientific spacecraft and associated communications networks.

Papers should be submitted for consideration by October 2. Include audiovisual support requirements (overhead, slides, video projection, etc) and a biography to be used in the proceedings.

Papers must be submitted in camera-ready form (8-1/2 x 11 inches), via MS-DOS compatible disk or via electronic mail formatted for printing. Papers containing graphics or pictures must be submitted in camera- ready form. Authors will be responsible for duplication and distribution of papers not submitted by October 2.

Submissions or questions should be submitted to:

Ralph Wallio, W0RPK
1250 Highway G24
Indianola, IA 50125

Send an SASE to W0RPK for a registration information package.

I am wondering if someone running a uucp-packet radio gateway could send
me directions for it's use? I appreciate that there is a [requirement]
for monitoring mail inbound to packet radio.

I would like to be able to send and receive small ammounts of packet mail
via uucp. My location is near Rochester NY.

Thanks much.

REMINDER FOR THOSE PLANNING TO ATTEND THE 8th NETWORKING CONFERENCE (7-8 Oct)

Reservations at the Marriott should be made no later than Sept. 6th to assure
the rates and space. Call (719) 260-1800, do not use the Marriott WATS number.
Request space for attendance at the "ARRL Networking Conference".

Please send your conference registration fee as soon as possible to permit us
to properly handle the expected crowd. Send, and make checks payable to:
Andy Freeborn, N0CCZ, 5222 Borrego Drive, Colorado Springs, CO, 80918
($20.00).

If you missed earlier news releases on the conference and need info call me
at: (719) 598-8373, or Compuserve 73177,1317 or N0CCZ@KA0WIE.

Thought someone might be interested in trying this. I will also be writing a routine to read uNET mail format for messages that you receive. For my log, anyone wanting to use the gateway please send me your full address and what class license you are.

Below is a routine that will allow access the packet network via WD5B Gateway. It is a kludge, but am interested in seeing how the system will work. Sorry, do not have a program to create a shar file. Cut along lines with appropriate file names. Any questions to Richard Duncan WD5B @ WD5B.

No flames, RTFM's, dummies or other self-defeating comments. This is one of my first shell scripts, any corrections or help would be appreciated.

Documentation (as much as there is!):

                                        UM
    A mailer script for uNET uucp -> packet Gateway

UM is a short script to allow individual users access to amateur radio
packet via uucp mail.  The mail should be addressed to argate!unetadm.
The system is self prompting.  Edit the file to put your personal information
like callsign, zip local system!username and on down in the routine your
favorite text editor (vi is default).

1.  Create directory mailer in your area and a subdirectory of address:
          mkdir mailer
          mkdir mailer/address

2.  Put UM in ./mailer.  Make sure you chmod um to execute.
3.  Create a file to handle message numbers in ./mailer:

          cat > umailder.nbr
         0
```

```
        <ctrl-d>
```

4. Go into ./mailer/address and construct your addresses by a keyword. This can be any single word. UM will prompt for the mailing address and use this keyword to get the path.

For example:

```
         cat > argate
         texbell!ark!lrark!argate!unetadm
         <ctrl-d>
```

You may create any number of addresses depending on the various system you want to send the message to.

That's it. UM will prompt for the information that it wants and use the information you put in the script to configure it for your system. This will get things started. You may now send mail to the system. I will read the mail as unetadm and place the file in a directory that will allow uNET to pick up the message and distribute it out on the packet network, whether destined locally or around the country/world. Naturally, this is going to require a little knowledge of packet on your part as to distribution, etc. I will help as much as I can.

In the Arkansas area, we have the following bbs systems:

```
         WD5B   Arkansas Gateway
         KC5JH  Primary user bbs in Little Rock
         N5ALU  Ft. Smith
         KA5BML Springdale
         KD5LF  Cherokee Village
```

Let me know of any questions and/or comments.

Rich WD5B @ WD5B
Arkansas Gateway

```

> -Val Christian (N2EPO)
> ...attctc!swamps!val
> ...rochester!kodak!swamps!val

I can handle your traffic. The format is quite easy. Mail your messages
outbound to:

...!texbell!ark!lrark!argate!unetadm

With the following format:
Sx <to> @ <bbs> < <from_your_call> $<bid>
<subject>
.   #
.   # x is the type B - Bulletin, P - Private
text   # or T - NTS traffic
.   #
.
/ex

So, a message to w2xyz from you could be:

SB W2XYZ @ W2AAA < N2EPO $N2EPO_1
Hello, got an access
Hi Elmer,
   I thought I would say hello to you. Long time no hear. You can
contact me via packet at N2EPO @ WD5B.   Val, N2EPO @ WD5B
/EX

When received, it will flag it as okay and it will be picked up by my
gateway system (WD5B), normally done on a daily basis. . Replies may

be mailed directly to you for those received here. Use your return packet address as N2EPO @ WD5B. Return mail will be automaticly forward to you via uucp.

I have written a script file that will prompt for the information and make things a little more organized on your end. Will pass that along as soon as I get a little documentation included.

copied from packet:

```
 Msg# TSP  Size #Rd Date/Time MsgID        From   To
  2627 BF   1043   2 0904/0022 4650_WA2SNA  WM8J   ALL@ALLBBS
   Sb: TM231PACKETMOD
```

THE FOLLOWING IS AN EASY MOD TO SQUELCH THE AUDIO AT MIC PIN 6 FOR TNC'S

WITHOUT TRUE DCD: OBTAIN FROM KENWOOD A 2SD1757(K) (SURFACE MOUNT TRANSISTOR). INSTALL EMITTER TO MIC PIN 8, COLLECTOR TO MIC PIN 6, AND JUMPER FROM BASE TO THE UNUSED PIN ON CONNECTOR 202. USING THE UNUSED PIN RATHER THAN RUNNING THE JUMPER TO THE MOTHER BOARD PRESERVES THE PLUG IN FEATURE OF THE FRONT PANEL. CONNECT ONE END OF A 4.7 K RESISTOR (I USED A 6.8 K) TO THE MUTE LINE (IC 5 PIN 7), AND CONNECT THE OTHER END TO THE UNUSED PIN OF CONNECTOR 4, WHICH MATES WITH CONNECTOR 202. THIS NEW CIRCUIT IS A CLOSE COPY OF THE AF MUTE CIRCUIT THAT SQUELCHES THE RX AUDIO AT THE SPEAKER. IT WORKS PERFECT WITH MY PACCOMM MICROPOWER 2. THE HARDEST PART OF THE MOD IS REMOVING THE LOCKING RING AROUND THE MIC CONNECTOR. I USED A MODIFIED TABLE FORK! GOOD LUCK.

I am having trouble with the KA9Q TCP/IP package for the PC.
Everything seems to work fine on a seriel connect of two IBM's
(SLIP-protokoll) when the baudrate is lower than 4800. On higher
rates, machines get stuck. I have tried both, the build in and the
packet driver, none had worked.

Possible errors:

   Modem control on the cable doesnt function (can somebody please
   tell me, how the correct ibm to ibm seriel cable has to look like !!!???)

   something in the network protokoll parameters isnt tuned right for
   the seriel transmission.

I have tried Ethernet (WD8003e) and it works fine !!!!!

If somebody out there in netland is using the KA9Q-Package, please

write me, I think it would save a lot of time and trouble.

H.-J.

>those of us who can provide such service? (Read: Unix with ptys. I've
>submitted a pty driver for System V/AT to comp.sources.misc for this
>purpose.) I'd hate to reinvent the wheel...

Yes. Any time you compile with 'UNIX' defined (as you will if using
makefile.unx), you get an extra server called 'telunix'. In your startup
file, just 'start telunix' instead of 'start telnet', and your incoming
telnet sessions will be hooked to pty's.

It's a bit rough yet, you'll have to play with eol and stty settings, but it
does work.

There has been some discussion of moving the 'telnet' server to some port
other than the telnet port, but nothing has been nailed down yet. Part of the
reason is that there's this feeling running around that we ought to do a real
"talk-like" split screen chat application, and use that for packet qso's, and
reserve telnet for real logins. Dunno what we'll do yet...

Hi All!

I am considering getting into Packet Radio and would like to setup a
UseNet TranContinental Hop with it. Can packet be used to send uucp/
usenet/fidonet etc mail? What is the best book available that tells
you the step-by-step approach to becoming a packeteer from just a lowly
technical type (not even a HAM). I am familiar with communications
programming so you can just give me the 1,2,3 steps necessary to get a
decent station up and running.

I hate to burst your plans but a USENET or FIDONET link
as you describe would be blatently illegal over amateur
radio. The first problem is that someone has to accept
responsibility for the traffic conforming to the FCC
regulations. Business traffic, profanity, and messages
to or from certain foreign countries are right out.
The only USENET connections that I'm aware of have humans
on the HAM/NON-HAM boundry.

Second, the only real transcontinental packet is being done
on the lower frequency (HF) bands. Unattended operation of
stations is not permitted there. There is an experimental
HF forwarding network on HF now, but that is operating under
special authority from the FCC.

However, there's plenty of fun and usefulness that can be
done with packet radio. To get started, you do need an
amateur radio license. The most common is a Technician
class license that requires you be able to receive 5 WPM
morse code and answer about 60 multiple choice questions
on radio theory and regulations. You can get code tapes
and study guides from Radio Shack among other places.

In article <27400001@tippy> fireman@tippy.uucp writes:
>What is the "$<bid>" used for?

This is used to avoid duplication of your bullitin on BBSs as your bullitin propagates thru the regiom you wanted. If you don't use it, a far-away BBS could receive your bullitin via several paths, and it wouldn't know that these bullitins were the same one. The bullitin would be posted multiple times needlessly. To make the bid work, do this format:
SB ALL@ALLBBS $###_call
where ### is an id number you assign, and call is your callsign. You don't have to use exactly this format, but if you happen to use the same bid that someone else used, your message will get ignored (the BBSs will think it's a duplicate of something it received already). Using your call in the bid should make it unique. Example: if this was packet and I wanted to send this as a bullitin to the USA, I'd do

    I am the operator of a system (lopez) which is on this network, and
    is also home of a local public access system, one of two such systems
    in my community. For a long time now, myself and the operator of the
    other site have been talking about linking our two systems into a
    "megasystem", allowing file transfers, multi user chat over both
    systems, and other nifty features. As we are both fairly innovative
    in our concepts (the activity between our two systems has

resulted in making our community very unique as far as local small town telecom goes)... we are constantly looking for new ground to break.

Our idea of linking the two systems prompted me to consider a RADIO LINK. While both our systems are NON COMMERCIAL, I would prefer not to do it as a HAM PACKET system, but rather to apply for either a commercial, or non commercial experimental license, BUT would like to use a packet type technology for the link.

I know of no work that has been done in this area, and am not sure where to start. I am figuring on using microwaves or "high end UHF" for the link. I would like the data to go at least at 9600 baud if at all possible.

Yes it would probably be easier to just run a dedicated phone line between the two systems, but THIS would be more fun, and something useful might come of it. Tinkering and experimenting are also something we both get into (although the other op is NOT a ham, he IS an SWL)...

I would like to put out a plea to members of the net to give us as much input as possible on the feasibility of this project. Don't just write and tell me we are insane, we already know that....

What type of hardware is avaialble, what frequencies would be recommended? How hard it it to get an experimental license?

My system is a non profit corporation.

The discussion is probably more suited to EMAIL, since technically it is NOT Ham radio, though will draw heavily from the packet technology.

I am also wondering the legality of setting up a packet bbs, and linking it with my landline unix system, and thus allowing this conference to be available over the airwaves, and allowing users to send email via a combination of packet and landline. How do third party agreements enter into this? Must I read and approve each message (as the licensed amateur operator of the pbbs?) Enquiring minds want to know....

The main thrust of this post though, is the feasibility of the proposed radio link (non amateur, either by experimental or commercial license) using packet technology.

I hope to hear from some folks out there... If anyone has done such a thing, I would like to know about it...

>regulations. Business traffic, profanity, and messages
>to or from certain foreign countries are right out.

The rules regarding international amateur third-party traffic apply only to direct communication between amateur stations; it doesn't matter whether we have a third-party agreement with the country that is the ultimate source or destination of the traffic.

For example, if the US has a third-party agreement with country B but not country C, but countries B and C have agreements with each other, then it is perfectly legal to route third party traffic to or from country C via country B. In networking terminology, the third party rules operate at the link layer, not at the network layer.

This may seem like a shady legal loophole, but it actually makes sense when you consider that the reason for third party agreements (or, more accurately, the lack of same) between pairs of countries is so that the countries involved can protect their monopoly interests in the international common-carrier routes between them. It is perfectly legal for you, as an American ham, to accept third-party traffic by radio and forward it to Europe, as long as you use the telephone instead of radio for the hop across the Atlantic, and as long as the station you accepted the traffic from is either in the US or is in a country with which the US has a third-party agreement. The source or ultimate destination of the traffic is irrelevant.

Here's another way of looking at it. The US Government, as a matter of public policy, does not protect any US telecommunications carrier from the loss of revenue that occurs whenever a US ham uses radio instead of a common carrier to carry messages between points inside the US. (Assuming, of course, that the messages are otherwise suitable for amateur radio -- no business or obscene communications, etc.) For a foreign country to be able to determine what can or cannot be said over amateur radio between points in the US would be a violation of the sovereignty of the US government over domestic communications.

In other words, if you distributed USENET messages via radio to other stations in the US, you would have to screen them for content but you would NOT have to worry about their country of origin.

Phil

I posted The following message to the tcp_group and am reposting here
for the prevailing benefit of interested Packeteer's!

Sent: 09/09/89 10:28 Rcvd: 09/09/89 11:01 Number: 59
To: tcp-group@ucsd.edu From: Doug Yuill
Subject: Distribution of NET

It seems we see lots of requests for NET executable's for the various
machines that NET has been ported to. Is our distribution mechanism so
ad hoc that we don't have a current (to within 12 months) list of people
who will send you NET for your particular hardware?
I would like to offer to distribute NET for the Macintosh & IBM pc for a
DONATION of $15 to our local working group. I expect to have both the
the old version and the new version of NET for the Amiga and if Rob wants
to send me his Atari version I'll send him the current Mac distribution.
Any other keepers of the bits (do we have a xenix port?) who wish me to
distribute there versions of NET please send them along.
As I have an interest in user testing I may also be able to provide help
in cases where potental NETer's get hopelessly lost in the documentation.
Please mail your disks or dollars to:

U.S. hams may want to obtain the Macintosh version from:
     Doug Thom N6OYU
     1405 Graywood Drive
     San Jose, CA 95129

Doug is the project coordinator for the Macintosh port, so he always
has the latest version.

In Europe, Jean-Pierre Szikora (LUDWIG@BUCLLN11.BITNET) has offered
to provide the same service. He's at:

     Institut Ludwig
     74, av. Hippocrate UCL7459
     B-1200 Brussels   Belgium

Please send a blank (preferably formatted) 800K disk with a return
disk mailer and appropriate postage or IRCs.

Remember--this is for the Macintosh version only! You DOS folks are
on your own. :-)

Patty

(Sorry for the separate posting to r.h-r and r.h-r.p, but the original
articles were posted separately and I didn't see the one in .packet
until after I'd posted my followup in r.h-r.)

In the past few days I was passed a copy of a press-release and
data sheet of a "radio modem for PCs". A friend saw the product
being shown at a trade show months (a year?) ago using HAM FREQUENCIES!
He filled out the card for more info, got a brochure then, and now
an update.

This claims to be a radio-in-a-pc-card, now with type acceptance
for 450-470 MHZ business band. They also claim versions can be
made to work in 406-420 MHZ fed government band, and 420-450 MHZ
HAM band!

They claim 2 watts, up to 15 mile range, and 9600bps. They use
what they call "RX.25" protocol.

In all fairness their brochure does say "Use of radio frequencies
may require prior authorization; consult your local FCC office
for policy and regulations." I am however concerned by the fact
that they used HAM frequencies at a commercial trade show.

If you're interested, contact:
     Megadata
     Bohemia, New York
     516-589-6858

DISCLAIMER: I have NO knowledge or interest in this product
beyond what I read in their data sheet.

Well, you really ought to check out your facts before you post a message. I have spoken with the FCC and they disagree with your analysis. If the intent is hobby communications, then they see no problem. If the intent is business, etc, then that's another matter. My packet/Fidonet interface has been operational and in service for well over 6 months and runs unattended, with full knowledge by the FCC, since I checked with them first. Of course, I don't port all the Fidonet echos over, just HAM, PACKET, and SHORTWAVE. I also don't send the Fidonet mail traffic by radio, but by phone. At any rate, it isn't blatently illegal, at least according to the FCC.

You might try WD5B @ WD5B or richard@lrark.UUCP. We are running three such systems here in Little Rock. Rich is the gateway station. The other two are only beta sites to help test the software. Keep in mind its UNIX-based.

There is a lot of amateur radio stuff on LOUIE.UDEL.EDU.
You can also find the latest KA9Q stuff on FLASH.BELLCORE.COM.

TheNet is not an IBM-PC package. It is code that gets compiled
to run in TNC2 ROM's. This is generally recognized as an outright
decompilation of a commercial product (NETROM) and you should
probably steer clear of it. If you are interested in the NETROM
node protocol, the KA9Q code includes an implementation as part
of the package that was independently written. It's probably
of more use to you.

The Story of Digipeter Rabbit -- A No-Code Fable

Written by Frank Terranella, N2IGO

Once upon a time, in a far-away kingdom of Radio, there was a peaceful valley called Hamville, inhabited by a group of rabbits. Hamville was orginally settled by the Whiskey family, and the patriarch of that family was an old hare called Charlie Whiskey.

Charlie Whiskey was a farmer by trade. He came to the beautiful valley of Hamville when it was all open meadows. He saw the potential for farming the vacant land, and over time he developed a thriving carrot plantation. Charlie Whiskey's carrot plantation was the envy of all the inhabitants of the kingdom of Radio. He succeeded year after year in producing a bumper crop of carrots. All the other residents of the kingdom came to Charlie for advice on planting carrots. Charlie would always tell them, "The secret's in developing a good ear". No, Charlie didn't have superior hearing, but he had developed a very special skill. You see, Charlie picked his carrots with his ears.

In fact, Charlie had worked hard at perfecting this skill and was able to harvest at better than 20 carrots per minute. All of Charlie's family learned to pick carrots with their ears. Soon they were all picking at better than 20 carrots per minute. Charlie was so proud of his special skill that he insisted that everyone who came to work in Hamville first show that he could pick carrots with his ears. Charlie would not give new settlers any land unless they could demonstrate to his foreman, Victor Echo, that they could pick at least 5 carrots per minute with their ears. When they could pick at 13 carrots per minute, Charlie gave them more land to work. When they were able to pick carrots by ear at the rate of 20 carrots per minute, Charlie made them full citizens of Hamville.

This process of learning to pick carrots with your ears went on for some time. In other parts of the kingdom of Radio, other rabbits began to pick carrots by ear, however, there were some noisy ducks, known as the Quackers, who lived in the community of Good Buddy. They used their mouths to pick their crops instead of their ears. They had much larger mouths than the rabbits and

saw no need to use their ears. The rabbits all looked down on the Quackers. "We must always require ear harvesting skills for entry into Hamville", they said. "That way we will keep out those noisy Quackers." So everyone who came to Hamville had to learn how to pick carrots by ear if they wanted to stay. Charlie Whiskey was adamant about that. "If you don't want to learn the skill of ear harvesting, then go work in Good Buddy with the Quackers", he would say.

And so the years passed, and new methods of farming were developed. These new methods were easier to learn than ear harvesting, especially for the animals who didn't have the big ears that the rabbits had. What's more, the new methods were just as efficient as ear harvesting. As time went by, fewer and fewer of the young animals were willing to learn the skill of ear harvesting. The population of Hamville began to dwindle. All the residents of Hamville were getting on in years. To make matters worse, there were new neighbors nearby who coveted the beautiful open farmland of Hamville. They wanted to come in and use it for commercial uses like shopping centers. And worst of all, the pollution from the Quackers, the other rabbits, and the Mice (known in Hamville as the QRM group) was having an adverse effect on farming in Hamville. The future looked bleak indeed.

Then, one day, a stranger called Digipeter Rabbit came to Hamville. He was an educated rabbit who studied at the School for Scientific Business (SSB). He had majored in Farm Mechanics and knew all of the latest scientific agriculture methods. But for all his education and know-how, there was one thing that Digipeter could not do. He could not master the skill of picking carrots with his ears, and since he already knew how to pick carrots more efficently with new scientific methods, he was not interested in learning.

Charlie Whiskey was outraged. "What do you mean you won't learn to pick carrots with your ears? Why, we in Hamville have been picking carrots that way for 75 years. It's a tradition here. It shows that we're special and that we're better than the Quackers. If you don't have the desire to develop a good ear, then we don't want you here in Hamville."

But Digipeter was adamant. He saw no reason to learn an obsolete skill just to stay in Hamville and he refused to even try. Charlie Whiskey took the matter to the Ancient Royal Rabbit League, which he founded. The ARRL decreed that everyone in Hamville must learn to pick carrots with their ears or be banished. And so Digipeter Rabbit left Hamville and founded his own village called Techietown.

Soon, all the young animals in the land of Radio were flocking to Techietown, but Digipeter had his own entrance requirement. A good ear and a good memory were not enough for him. No one could stay in Techietown unless they could demonstrate technical knowledge, understanding and ability, and the desire to contribute to the advancement of Techietown.

Digipeter encouraged all the residents of Techietown to experiment in the cultivation of new unexplored lands, never before farmed. Digipeter showed them how to overcome pollution problems. He showed them how to use the land they had more efficently. Digipeter even perfected a method of farming which allowed a number of rabbits to farm the land at the same time. And while the

residents of Hamville were picking 30 carrots per minute on a good day, in Techietown harvests of 300 carrots per minute were possible. Using Digipeter's methods and those developed by the other bright, young residents, Techietown soon became the most prosperous village in the kingdom of Radio. This did not escape the notice of the Field Carrot Council, which governed the kingdom of radio. To reward the residents of the kingdom, the Field Carrot Council gave Techietown more and more land to work, until its borders touched those of Hamville.

Meanwhile, Hamville was still plodding along as it always had, oblivious to the revolution in farming occurring around it. The old hares still picked carrots by ear. The Ancient Royal Rabbit League complained bitterly to the Field Carrot Council about all the new land it was giving to Techietown, but the population of Hamville continued to drop. When the Field Carrot Council gave 2 acres of Hamville property to Techietown, the residents of Hamville began, for the first time, to be genuinely concerned about their plight. Some even dared to ask the Ancient Royal Rabbit League to change its mind about the need to learn to pick carrots by ear to live in Hamville. "We need new blood here to fight off the Field Carrot Council", they said. Charlie Whiskey, now in his nineties, was furious. "We have to maintain our standards. We don't need those smart young bunnies, we need rabbits skilled in our time-honored harvesting techniques. We need rabbits who are dedicated enough to the principles of Hamville to want to learn our methods. If a rabbit really wants to live here, he'll learn our ways. If he doesn't, we don't want him. You don't want those Quackers to move here, do you?"

But by now the residents of Hamville had seen the writing on the wall. Although they genuinely enjoyed picking carrots with their ears, they realized that there were now other ways which yielded just as many carrots. And though they would probably continue to pick carrots by ear as they always had, they could no longer shun those bright young rabbits who chose a more modern method. A group of rabbits, led by an elder statesman rabbit named Elmer, who had once served in the government of the kingdom of Radio, asked the Ancient Royal Rabbit League to change its policy. The League agreed and issued a decree that henceforth ear harvesting skills would not be required to become a resident of Hamville.

When Digipeter heard of the decree, he sent envoys to Hamville with all the latest scientific discoveries, which he shared freely with the residents. The residents of Hamville seized upon the new knowledge and soon Hamville became revitalized. Its population began to increase as young rabbits were attracted to its bountiful open farmland. The Field Carrot Council, impressed by the renaissance in Hamville, did not take away any more land, but actually gave some new territory to Hamville. Everyone was amazed at the new vibrancy of Hamville.

Charlie Whiskey, though sad that his beloved harvesting method was no longer in vogue, saw that his people were prospering and was glad. And to show that there were no hard feelings, Charlie Whiskey sent Digipeter Rabbit a packet of 73 carrots which he had picked himself -- with his ears.

The residents of Hamville rejoiced and declared a festival to celebrate their new prosperity, and over the front door of the Hamville Festival they

put a banner, which read: "A bunny's worth is measured not by the skill of his ears, but by what lies between them." The residents of Hamville had learned an important lesson.

   The End.

[I'm posting this for a friend. Since I'm not into ham-radio, I have no
idea of what it is all about.]

Hi,

I'm looking for packet radio software for the Amiga-series computers,
escpecially a software implementation of the TNC-functions. I would
be very grateful for any pointers concerning this. Thanks in advance!

Hi!

I'm a bit new to this area, and especially new to this topic. (In fact, I'm currently studying for my novice classification.)

The reason I became interested in packet radio is that a friend mentioned it to me and thought it would be a good way to "open up" my BBS to a whole new world.

Has anyone had BBS experience with packet radio, either as a user or a sysop? What's it like, and what's generally used for equipment?

Dear All,

Does anyone on the net have information on mailboxes in West Germany.
I am paticularly interested in contacting friends in Iserlohn, a town
to the south-west of Dortmund. I would appreciate details of callsigns
for mailboxes/nodes in :-

Iserlohn/Altena
Duesseldorf
Dortmund
Hagen/Schwerte

I've posted in English since there maybe others outside DL who could help.
I am fluent in German, so write in Deutsch if it's easier !!

73 & 55,

Mike

Bdale: This [TheNet] is generally recognized as an outright
Bdale: decompilation of a commercial product (NETROM) and you should
Bdale: probably steer clear of it.

Detlef: This is simply wrong. Such flames are mostly derived from
Detlef: third hand rumours which are based one pure commercial propaganda.
Detlef: If you're interested to read some first hand information take a look
Detlef: at PR-Digest #159 of 9th june 89. If you missed it let me know.
Detlef: I'll forward this info to anyone who's interesed in it.

I have remained mostly quiet in the NET/ROM vs TheNet battle, but I
cannot let Detlef's assertion go by unchallenged.

Bdale and I are both members of the TAPR board of directors. At our February meeting, we were shown listings of both NET/ROM and TheNet source code.

It was immediately obvious to all who examined them that the two versions could not possibly be independent efforts. The only significant differences between the two were:

1. The addition of German comments to the TheNet source.
2. The consistent reversal of function argument ordering (i.e., if NET/ROM called f(a,b,c) TheNet would call f(c,b,a).
3. Different choices for variable and function names.
4. Minor variations in C expression coding and formatting. These variations were functionally equivalent; i.e., they generated the same object code.

All of these observations were completely consistent with the assertion by Software 2000 that TheNet was generated by a "decompilation" effort that started with NET/ROM's object code. Such an effort is a clear violation of US copyright laws, which protect "derivative" works as well as the original.

Concerned about this situation, the TAPR Board sent a letter to NORD><LINK asking for a response to the charges that had been made against them. NORD<>LINK responded by essentially conceding to the accusations, but refusing to admit that there was anything wrong with their actions.

I personally believe that amateur packet radio is best served by software (including full source code) that is freely available to every interested amateur, both for on-air use and for personal study and experimentation. I have acted on this belief by starting the KA9Q Internet Protocol Package and encouraging others to contribute to it. I believe my approach has been very successful.

But others may decide to produce their amateur radio software on a commercial basis only. Even though I may regret such decisions personally, I fully respect the authors' rights to make them. There is plenty of room in amateur radio for both commercial and non-commercial software packages.

If NORD><LINK had written its own software, from scratch, so as to be functionally compatible with NET/ROM (i.e., by meeting the protocol specs documented in the NET/ROM manual, and by interoperability testing with NET/ROM implementations) then its effort would have been perfectly legitimate. Such projects are quite common in the computer industry. Examples include the non-IBM BIOS ROMs found in "clone" PCs, and the NET/ROM-compatible code contributed to my TCP/IP package by Dan Frank, W9NK (with the blessing of Software 2000, I might add). But TheNet does not fall into this category; it is clearly derived from Software 2000's original work.

The non-commercial people should respect the proprietary nature of the commercial packages. In turn, the commercial folks should continue to

respect the right of others to INDEPENDENTLY produce packages that are
functionally similar to their own, as Software 2000 has with W9NK's
NET/ROM code. (Thank God we have no "look and feel" lawsuits in amateur
radio.)

Dear Phil,
although I agree to what you say in this passage 100% and very much respect
your efforts, I have one remark to make.

The non-commercial people write their fine software for everybody, that means also for the commercial people. And they use it in their commercial packages (like Apple using lots of FSF software). We found big hunks of literally copied public domain software in expensive commercial packages (by reverse engineering). So who is really pirating on whom?? Isn't per definition public domain software deemed to be victimized by the commercial companies? So if somebody is sued for unallowed copying of commercial software, shouldn't there be any investigation of how much of the copied software is based on public domain software? Can the glueing together of public domain software by a little original code into a commercial package be called a protectable artistic effort? How many really different ways are there to write a certain software implementation? Some time ago I read that all those companies sueing others for break of look and feel protection (like Apple e.g.) were sued on their part by a company who held the rights for

bitmapped displays. Somehow they must have arranged as it it rather quiet now about this business.
Sorry for taking up your time, just some loose thoughts going round and round my brain...

Mhh. CONVERS mode is no significant difference ?

I don't know of any statement of any NORD><LINK member claiming
TheNet is an independent development. See PR-Digest #159:

: [df2au writes:]
:- the first crossband digipeater/node was made by NORD><LINK from TNC1s
:by connecting them thru the RS232 ports. We used a TNC source supplied
:to us by WA8DED and sent back the results (as source and documentation)
:to WA8DED. At that time there was some discussion with WA8DED and W6IXU
:on how to build a backbone. But only the crossband digi came out of that.
:If you look at the sources of that digi/node and of TheNet you will find
:similiar structures and variable names. This was long before NET/ROM
:appeared on the scene.
:
:- TheNet was made using a different compiler version and a different
:optimizer then NET/ROM. The optimizer shrinks the code by some 30%. So
:the process "disassemble-deoptimize-decompile" could not work. How
:deoptimize if you don't know the way original optimization was done,
:how decompile if you don't have the original compiler? Have you ever
:heard about a decompiler that adds comments to the source?
:
:- TheNet contains a lot more features and less bugs than NET/ROM.
:
:- The report from WA6IGY is wrong in some parts (type of auto variables,
:optimization, etc).
:
:- Level 1 and Level 2 of TheNet are made by minor changes to
:TheFirmware which is compatible to WA8DEDs firmware but is much faster
:and has less bugs and more features (another clone which WA8DED doesn't
:care about).
:
:- After a short look at the sources any programer will tell you that it
:would have been extremely simple to hide any similiarities to NET/ROM -
:if we had wanted to do that. On the contrary: we put a lot of work into
:TheNet to make it as close to NET/ROM as possible.
:
:- We never told anybody that TheNet is an independent development. We
:always stated that it is a clone of NET/ROM.
: ....

:73, Georg, DF2AU @ DK0MAV, on behalf of the NORD><LINK programers

> [ka9q:]
>
>All of these observations were completely consistent with the assertion
>by Software 2000 that TheNet was generated by a "decompilation" effort
>that started with NET/ROM's object code.

Maybe somewhat consistent, but wrong anyway.
(this is the commercial propaganda. The propaganda term in my previous
posting doesn't relate to TAPR's observations)

I have to make one thing clear:

I was not personally envolved in programming of NORD><LINK's software,
neither TheNet nor TheFirmware. So don't blame me for serving infos
that some guys don't like (like S2000 did before).

But I know it took DC4OX and DF2AU
an enormous amount of time to write the software. They developed
and realized the concept of connecting TNCs back-to-back to act as
an interlink node controller. They sent the relating software
to california (see above). I developed and published a protocoll
version allowing hop-to-hop ACKs within AX.25.
And all this happend long before NET/ROM was available.

So should we blame S2000 to have stolen NORD><LINK's ideas and
sell it to the HAM community ?

If you like clones or not: it's your choice. If you don't like them
stay clear of PCs not labeled with a blue button. Unfortunatly
you can't use the TNC2 in this case, even not together with NET/ROM.
Because it's CPU Z80 looks like a clone of the good old 8080,
compatible bit for bit, and a superset of 8080's functions...

73s Detlef

Well, I'm diametrically opposed to the position taken by TAPR and Phil.
I think TAPR has lost a lot of credibility in this move. More disturbing to
me than the TAPR action however, is the above comments by Frank which reflect
a total ignorance of the copyright laws and the meaning of public domain.

Frank, when someone releases a work to the public domain, he relinquishes all

ownership and control. There is NO restriction on reuse or copying. I can take public domain software and:

Exerpt portions for my own use
Exerpt portions for commercial gain.
Copy the work in its entirity
Copy the work in its entirity and sell it for commercial gain.
And by some legal opinions, put my own copyright on it and restrict your use.

The above is what you can do legally. Ethically, I attribute any public domain code I use to the original author if known.

The statement "copyright 1989 Joe Cool, All rights reserved, Released to the public domain." seen in many PD packages is an oxymoron and has no legal meaning. It is one or the other but not both. My copyright attorney's opinion is that the public domain clause will rule because the courts usually resolve such conflicts toward the benefit of the public - of course, assuming someone was so stupid as to sue.

Much less clear is the status of such packages as Phil's net program which exhibit all the attributes of public domain software but retain copyright protection. I've discussed this situation with my lawyer at length because it affects my ability to exerpt useful algorithms without undue concern. My lawyer cites the Duck principle of law - "if it waddles like a duck, quacks like a duck, swims like a duck, you can call it a cow but it's still a duck".

As to your characterizing anyone who exerpts public domain software for profit as "piracy", it appears that your deep seated resentment of people who make profits is showing. It is no more improper or unethical for me to incorporate public domain code into my product than it is for you to take information gleaned from published papers and resell it as a consultant's work product. Knowledge belongs to anyone who puts forth the effort to acquire it, some extremely narrowly classified areas reserved by intellectual property law. Strictly as a professional courtesy, I normally notify a PD author that I'm using some of "his" code.

Now back to the issue of TAPR and Nord><Link. I find it fascinating that people will piously pontificate against the reverse engineering job done by Nord><Link while they themselves are using a PC clone. If you are not using genuine Big Blue PC hardware, you are using a blantantly reverse-engineered product. Absolutely no difference than the Nord><Link work. Let's remember a few facts:

* As far as I've seen, Ron Rakes has never claimed Nord><Link stole or even had access to the source for NET/ROM.

* The source published by Nord><link is C source, not assembler which would be expected from a decompillation effort. If anyone has an algorithm for decompiling an optimized binary back to C source, I'd like to know about it. We've seen "evidence" from a variety of sources

that the Nord><Link and NET/ROM sources are the same. Each opinion I've read has carefully avoided any discussion of HOW the 2 sources arrived at the state they are reputed to be. I smell a fish.

* Rakes has thus far failed to take any public action to protect himself against this alleged "piracy". He has instead chosen the public forum to make his allegations. A forum where rumor and innuendo rule.

  If his very venomous allegations have a molecule of substance, why has he thus far not even sought an injunction against further distribution? No, it could not be enforced but the outcome of a legal proceeding would be respected by many hams. I suspect that few of his allegations would withstand the scrutiny of law.

hat has really happened here is that Rakes took a publicly (*not "public domain") developed protocol running on a publicly developed hardware platform incorporated into a publicly developed and supported network and sold a commercial product that exploited these works. Ok so far. Remember that releases prior to 1.0 were distributed publicly without cost so the good 'ole free ham community could help him refine and debug the product. Still sort of OK. Then he released the commercial version complete with encrypted callsigns, high prices, almost full price for call sign changes and rip-off bug fix release charges. The market responded with Nord><Link, a product of some people who were apparently pissed off enough to do a fine job of reverse engineering. And then to pour gasoline on the fire, after Nord><link hit the streets, Rakes suddenly comes out with a low cost (or free, I don't remember) "upgrade" that contained intentional incompatibilities with both the old NET/ROM and Nord><Link. And all the while yelling bloody murder in public and sitting on his hands legally.

I remember well when Nord><link arrived where I was living. The dull blue glow on the horizon was hundreds of EPROM erasers firing off to purge NET/ROM from the face of the earth and replace it with Nord><Link. 95% of the people converting over had already spent the money on NET/ROM so it was not a case of people trying to be cheap. Rather it was a reaction to one of the more offensive commercial software policies this side of Lotus.

And now TAPR unilaterally decides to discontinue distribution of NORD><LINK? I am deeply disappointed.

John

Frank,

I fully agree with you in your dislike of commercial vendors basing
their products on code originally placed in the public domain. That's
why I copyright my own code instead of placing it in the public domain.
I have no problem with people using my stuff for noncommercial purposes,
but if they want to make money off it, I want to hear from them.

An alternative is the FSF/GNU "copyleft", which is a copyright that
grants use and distribution rights of the software only if the recipient
agrees to allow it (and any enhancements) to be freely recopied. This
effectively eliminates the ability of someone to make money off the
software.

Phil

>Frank, when someone releases a work to the public domain, he relinquishes all

>ownership and control. There is NO restriction on reuse or copying. I can
>take public domain software and...

Quite true. That's why I copyright my own works (e.g., most parts of
NET.EXE) even though I have no intention of making money off hams. (And
after the NET/ROM-vs-TheNet controversy, I'm damn glad I didn't even
THINK of trying to do so.) However, the ready availability of my code
does NOT lessen the protection my copyright gives against commercial
misuse of my software. Copyrights are quite different from trade
secrets, where you actually have to make an effort to keep something
secret in order to keep legal protection. The whole purpose of a
copyright is to protect an author's interest in a work even though it
has been widely disseminated to the public.

>Now back to the issue of TAPR and Nord><Link. I find it fascinating that
>people will piously pontificate against the reverse engineering job done
>by Nord><Link while they themselves are using a PC clone. If you are not
>using genuine Big Blue PC hardware, you are using a blantantly reverse-
>engineered product. Absolutely no difference than the Nord><Link work.

Absolutely incorrect. There is a *MAJOR* difference between the legal
process of reverse engineering and cloning (as typified by the IBM PC)
and the illegal process of direct code copying. The BIOS ROMs in PC
clones were made by programmers who had never even seen the original IBM
code. They wrote their own code from scratch to meet a set of written
functional specifications. The code is not identical at any level
(source or object) to IBM's original code. (There were some early PC
clones that did indeed use directly copied IBM BIOS ROMs. IBM jumped on
them quite hard, and the result was the carefully established cloning
procedures that now exist.)

>Let's remember a few facts:
>
>*   As far as I've seen, Ron Rakes has never claimed Nord><Link stole or
>   even had access to the source for NET/ROM.

No, he has not claimed this. He *has* claimed that NORD><LINK produced their
source code by reverse-compiling (not just disassembling) the object code
in a NET/ROM EPROM. Since the copyright law covers the translation of
copyrighted works, and "translation" includes compilation and decompilation
of computer programs, this is clearly a copyright infringement.

>*   The source published by Nord><link is C source, not assembler which
>   would be expected from a decompillation effort. If anyone has an
>   algorithm for decompiling an optimized binary back to C source, I'd like
>   to know about it. We've seen "evidence" from a variety of sources
>   that the Nord><Link and NET/ROM sources are the same. Each opinion
>   I've read has carefully avoided any discussion of HOW the 2 sources
>   arrived at the state they are reputed to be. I smell a fish.

Decompilation is a tedious process, but it is by no means impossible.
Remember the Internet Worm of last November? There now exist something
like a half dozen separate versions of the worm's source code, and all

were produced by tedious manual decompilation of the worm's object code.

When I first heard the piracy accusations against NORD><LINK, I expressed considerable skepticism that a group of programmers skilled enough to reverse compile a non-trivial Z-80 object code program would spend their time on such a tedious and non-creative operation rather than write a functionally equivalent (and probably better) program from scratch. Nevertheless, my own examination of the source code for both versions has convinced me that Ron's accusations are correct: TheNet was indeed produced by reverse compilation of the NET/ROM object code. I simply could not come to any other conclusion.

>
>* Rakes has thus far failed to take any public action to protect himself

>   withstand the scrutiny of law.

For a very simple reason: the income Ron has made from NET/ROM could not possibly be enough to pay for a copyright infringement suit where the defendants are in a foreign country. Ron has decided instead to take his case to the court of public opinion, and I respect his right to do so.

Phil

Greetings everyone.

Was wondering if anyone out there in Packet-BBS land had successfully interfaced the AA4RE BB software to a phone modem (on COM1 or COM2)?

I am using a DRSI PC*PA for my TNC port(s) and would like to experiment
with putting a modem on COM1 or COM2.

I have COM1 open and have an internal modem operating on COM3. (I have
an external 1200 baud AA/AD modem that I would run off of COM1 for the
phone port access.)

Any comments/help/suggestions welcomed.

Also, on another note, if you are using the G8BPQ PC_Node software then
I would appreciate hearing from you also.

Best 73's...

>And now TAPR unilaterally decides to discontinue distribution of NORD><LINK?
>I am deeply disappointed.

I don't understand this remark. TAPR has had no connection with NORD><LINK
except for our unfortunate (in retrospect) decision to loan them an old
TAPR NNC (Network Node Controller) board for their development efforts.
It was only because of this that we even became involved in the controversy,
as Software 2000 felt we were aiding piracy by this loan. Our recent decision
was limited to the specific issue of whether we should request NORD><LINK
to return the NNC we had loaned them.

To my knowledge, TAPR has never had any role in the distribution of any
NORD><LINK software.

All of this discussion about the alleged copyright violation by
>NordLink< seems to be taking place under the rubric of US law.
However, NordLink is in Germany, not the US. It is quite possible
that "decompilation" of a ROM does not constitute a copyright
violation, there.

In any case, I find Raikes overall behavior to be sufficiently
reprehensible to render the question moot, for my own purposes.
His treatment of the JPL (?) ham club members was egregious.
Hell, the protocol is egregious! When NET/ROM first came out,
he distributed the technical documentation only under non-disclosure,
so we couldn't even discuss the protocol here (on the wireline
nets) until after it was widely in service. And it contributes
to making appliance operators out of packeteers, at just the wrong place
(the network layer) to bound things so tightly into a ROM.

NordLink can't fix the protocol, but at least they can fix the worst
misfeatures and bugs in Raikes' implementation. Since the protocol spec
is apparently not rigorously architected, it's quite possible that
the NET/ROM protocol, like (for example) rlogin, is really "defined by
the implementation" and thus reverse-engineering is the only way to get
it right. Or at least, if it's legal in Germany, the best way.

I know essentially nothing about German law....

>>It was immediately obvious to all who examined them that the two
>>versions could not possibly be independent efforts. The only significant
>>differences between the two were: ......
>
>Mhh. CONVERS mode is no significant difference ?

No, it isn't. Because I went through page after page of source code
listings, concentrating on the internal protocol layers that constitute
most of the software. Function after function, statement after statement
were identical except for the choice of symbol names.

DF2AU: We never told anybody that TheNet is an independent development. We
DF2AU: always stated that it is a clone of NET/ROM.

Since English is not your native language, you may not be aware that the
word "clone" as currently used in the US computer industry has a
colloquial meaning that is somewhat different from that given in most
dictionaries. The formal definition of "clone" implies "identical", as
would be produced by the direct copying of an original.

However, the word "clone" as used in the US computer industry implies a
product that, FROM THE OUTSIDE IS FUNCTIONALLY EQUIVALENT to another
company's product, NOT IDENTICAL ON THE INSIDE. As long as the "clone"
was produced from scratch by a completely independent development
project toward a set of functional specifications, it is legal. This is
how the BIOS ROMs in "clones" of IBM PCs are produced. The developers
of PC clones did NOT disassemble an IBM ROM, modify it slightly and
reassemble it, because that violates US copyright law. (Several
developers did indeed do just this in the early days, and IBM came down
on them very hard until the present legal cloning procedures were
established.)

In other words, you can still have a legal clone if it was produced by
an independent development. TheNet, as you now admit, was not developed
independently from NET/ROM; therefore it violates the copyright held
by NET/ROM's authors.

>But I know it took DC4OX and DF2AU
>an enormous amount of time to write the software.

This was quite apparent to me. Almost every line in the TheNet source
was commented in German, in stark contrast to NET/ROM's sources which
were almost completely comment-free. But this does not take away from
the fact that the code being commented was produced by a reverse-
compilation process in violation of NET/ROM's copyright. What I still
can't figure out is why a bunch of guys would be willing to spend that
much effort on a non-original work instead of writing their own code
from scratch.

Whose opinion? Something in public domain stays there. You can change
one LETTER, and copyright THAT, but the original is still in the public
domain; I can change a DIFFERENT letter and have a DIFFERENT copyright
on a DIFFERENT WORK.

> The statement "copyright 1989 Joe Cool, All rights reserved, Released to the

> a duck".

Seems pretty clear to me. Phil retains the rights, but grants specific
privileges to all or certain person (depending on the wording, I'm not
reading it right now).

I don't see any problem excerpting algorithms or code. Ask Phil for the
permission. He's a nice guy, I'm sure he'd not object.

Carrying out a civil law suit across international boundaries is EXTREMELY
EXPENSIVE. It would probably cost several TIMES the combined net worth of
both parties.

> And now TAPR unilaterally decides to discontinue distribution of NORD><LINK?

My comment above was in reference to a note that came over the BBS network
a few months back that stated that TAPR was a source for TheNet code. I no
longer have the traffic so I cannot supply any further detail. If that
statement was incorrect, then I withdraw my comment. I instead redirect it
toward the NNC unit. I am still deeply disappointed.

As an outside observer, I see TAPR giving very unfair preference to Rakes
and company based on personal relationships between Rakes and some of the
board members. I see the nord><link people being branded as guilty by
virtue of an absence of response. Fair? Hardly.. I see "evidence"
provided by an "independent" expert being taken at face value. From reading
his report, I can hardly call him unbiased. We have no indication that
the code he evaluated was even production code and not "ringer" code
prepared for the purpose of discrediting Nord><Link.

I'm not saying Rakes and company did this. But based on the extremely
hateful and spiteful statements Ron made, I'd be as prepared to believe
this possibility as I would to believe the Nord><Link guys explicitly
copied his code.

Since TAPR (and now we) are sitting in judgement, it is our obligation to
treat both sides fairly. If we are to take Rakes' word at face value,
we must also take Nord><Link's word. Detlif has stated that they
used a different compiler and a homemade optimizer on their code. In the

absence of proof to the contrary, I must accept that statement. He follows up with some pretty convincing evidence regarding work done BEFORE NET/ROM. Again, in the absence of proof, I accept that statement.

Nord><Link has, after all, presented pretty strong support for their side - the source code and the tools used to build the executable. I'd expect Rakes to make his source available for public scrutiny especially since he claims the Nord><Link code is identical. Then I'd expect a verification to be made that the source released actually builds a binary identical to an independently acquired NET/ROM.

At the same time, I'd expect the Nord><Link guys to release background work such as early prototypes, code fragments, logic diagrams and so on to show that the work is something other than a mechanical decompile (which I still seriously doubt to be practical on optimized code). Detlif, care to respond here?

I'd expect the 2 to look remarkably alike. There are only so many ways to do things on the Z80. And I'd expect Nord><Link to work from a disassembly of the NET/ROM. After all, how else could one determine all the subtleties of the protocol - even the undocumented features.

My last concern is that TAPR has delivered yet another blow to the NNC. Nord><Link had the most potential of making the NNC practical and useful. Considering the money and time invested in the device, I'd expect support to be given to any effort. (BTW, Detlif, I know a couple of guys here that have an NNC who might loan it out. Contact me if you are interested.)

Phil, there are some misconceptions in this statement. You state this as if it
were gospel, but it is NOT. The case law is unclear at best if converting a
program
from, say Basic, to C is a translation. Going from object code to C, is far from
legally or ethically a translation. Although the semiconductor chip act doesn't
cover software, that is one example of explicitly legal reverse engineering (ie.
copying).

Look at it this way: Comparing the original object code to the new C code, is it
obvious to the average person that more than 50% is different? I can believe that
there are many similarities, but that is not enough to warrant claims of outright
piracy.
I've acted as an expert witness (never needed to get to trial though) many years
ago
about a BIOS that was copied. In that case, it was a bit easier since assembler
is
so much closer to object.

A couple of other points: (1) How do you know that the source code you looked at
(months after nordlink hit the fan) is actually the source code was in existence
when the reverse engineering was done? It would be very possible (likely?) for
someone
claiming piracy to spend weeks tweaking their code to match the alleged pirate's
code.
Yes, the object generated might even be the same, but by careful work one could
make the source code look like a copy. (2) Is there really a registered, valid
copyright
of NetRom? What is the registration number and date? (3) I feel that if S2000 is
not

willing to at least take some legal action (it doesn't take lots of money, sometimes
less than $100 will accomplish enough), then they are by definition allowing their copyright to lapse into the public domain. If no action is taken, then they have declared netrom to be public domain -- and nordlink is golden.

This whole thing bothers me deeply. From ALL sides!!! It really does sound like S2000 was trying to be too commercial (greedy?) and they didn't like the community's
response so they're crying.

In response to John De Armond, WD4OQC:
John: you are making wild and irresponsible statements.
Ron Raikes and S2000 have no inside track with the TAPR BoD.
In fact, we stated repeatedly that we were not a court of law
and did not feel that it was our place to make a decision on
this issue. In fact, we felt that it was for the community to decide
based on clear facts, and not hysterical ravings by EITHER side.
We sent NORD><LINK a copy of the WA6IGY analysis. We stated that the
North American ham community had concerns re this issue and invited
a reply. They sent a reply. It did not speak to the questions that we
had raised. Therefore, we asked for the return of the NNC, and have
offered to cover their expenses.

Now, the NNC was closed as a project in late 1987 (by me) since the
people who had promised to write software hadn't (remember the caveat
that you should only get one if you planned to write code). In addition
we found that software tools were either expensive or non-existent.

So we asked for the NNC back because it was a matter of principle, since
they had avoided our questions. This does not imply a decision on the
part of the board as to who is right, and how right they are.

And just to help your disappointment, we never did say that we carried
the NORD><LINK software.

>his report, I can hardly call him unbiased. We have no indication that
>the code he evaluated was even production code and not "ringer" code
>prepared for the purpose of discrediting Nord><Link.

As a TAPR board member, I am completely unaware of any such personal
relationships. Ron came to us and presented his case. We stated that we
wanted to hear both sides of the story, so we sent NORD><LINK a letter and a
copy of the WA6IGY study. We stated in the letter that we would like a
formal response which we would make public. Only after their response came
and was read by every director did TAPR announce that NORD><LINK's response
had not satisfied the Board's concerns, and that TAPR would ask for the
return of the NNC it had loaned NORD><LINK. We made it clear to Ron from
the beginning that this was the maximum extent of the "relief" he could
expect from us; we are not a court of law, and we cannot act as one.

Throughout this whole sorry episode, TAPR has tried very hard to maintain an
unbiased position. We have in fact had to resist many attempts by some of
Ron's more outspoken supporters to get drawn even further into the
controversy, and we have sustained many attacks for this. I guess since
we're getting it from both sides equally, we must be doing things about
right.

>I'd expect
>Rakes to make his source available for public scrutiny especially since
>he claims the Nord><Link code is identical. Then I'd expect a verification
>to be made that the source released actually builds a binary identical
>to an independently acquired NET/ROM.

Those who have compared the versions have done exactly this -- verified that
the NET/ROM source code provided by WA8DED compiles into object code
matching that found in a legitimate NET/ROM EPROM.

>My last concern is that TAPR has delivered yet another blow to the NNC.

The NNC was already, for all intents and purposes, dead well before
NORD><LINK asked to borrow one. The design is completely inadequate for
serious packet switching use, despite the relatively high cost. (In my

opinion, TNC-2s are also completely inadequate for serious packet switching. But they are considerably cheaper than NNCs.) The PS-186 from SANDPAC is the machine you really want (if you want a dedicated hardware engine in the first place, that is) and I think it will assume the role originally intended for the NNC. N3EUA is already porting the KA9Q TCP/IP package (including W9NK's independently developed NET/ROM code) to it. In the meantime, lots of us are using stripped PCs as IP (and NET/ROM) packet switches, and they work great.

As for the TheNet-vs-NET/ROM controversy, this topic has totally consumed the HAMNET forum on Compuserve for at least the past six months. I do not want to see it happen here as well. Before commenting on this topic, I strongly suggest that everyone go read the volumnous record of comparisons and articles that have already been written.

>Well, I'm diametrically opposed to the position taken by TAPR and Phil.
>I think TAPR has lost a lot of credibility in this move.

John, for someone who normally strikes me as being extremely well informed, and bearing opinions that are quite objective, your reaction mystifies me... the only reason I can see for it is the awesome amount of misinformation floating around on the packet nets.

>Now back to the issue of TAPR and Nord><Link. I find it fascinating that
>people will piously pontificate against the reverse engineering job done
>by Nord><Link while they themselves are using a PC clone.

It's possible to go around in circles for years about this one. The only comment I'll make is that there's a distinct difference between "reverse engineering" as defined by legal precedent, and "decompilation". A lot of early "PC clones" that didn't adhere to the reverse engineering rules quickly dropped out of sight due to legal innuendo/action by IBM... what's left are, for the most part, legal examples of reverse engineering.

Having looked at the NET/ROM sources next to Nord><Link sources briefly at the TAPR meeting in February, I believe that Nord><Link either had access to Ron's sources (he claims not), or that they decompiled and tweaked. Even given a protocol definition, a compiler, and a target system... the probability of independent creation of two pieces of code with the similarities displayed is astronomically small.

>* The source published by Nord><link is C source, not assembler which
>   would be expected from a decompillation effort. If anyone has an
>   algorithm for decompiling an optimized binary back to C source, I'd like
>   to know about it.

Given a specific C compiler, and a specific target, this isn't as hard as you make it out to be. I've written hacks to do this often for small pieces of code (ever hear of binary Unix distributions? seems oxymoronic to me... :-) And, after all, compared to what I usually work on, 32k of ROM is nothing...

If Hans and company had access to Ron's sources at some point, this would all make more sense, but I'm not going to dismiss decompilation out of hand. I could do it myself if I felt so inclined... but I'd rather work on better bits! :-)

>And now TAPR unilaterally decides to discontinue distribution of NORD><LINK?
>I am deeply disappointed.

TAPR never distributed any NORD><LINK software, so there was nothing to discontinue. The *only* interaction between the two groups at all, despite lots of junk that's flowed across the packet networks to the contrary, was NORD><LINK's participation as a late member of the NNC beta-group. After a presentation by Ron at the TAPR board meeting in February, TAPR sent a letter to Germany asking for a specific response to the allegations made in IGY's comparison. We received a response that did little to answer the ultimate question of how TheNET was created. As a result, TAPR's board decided the most prudent course of action would be to request that the NNC prototype be returned, and that's that. We'd already canned the NNC project a year and a half ago, so it just shouldn't be a big issue.

I hope this helps to clear up some of the misinformation. Regardless, as TAPR President Andy Freeborn N0CCZ so eloquently put it, "I sure hope we can get back to work now". TAPR is, after all, primarily an R&D organization...

Here's another thing to try when you're trying to get your 2 meter radio to not hear TNC RFI. I separated the radio and TNC by about 10 feet, using about 20 feet of cable that has 3 shielded twisted pairs. I also used separate power supplies to run the radio and the TNC. All this helped a lot, but I found that putting a toroid ferrite bead coil in the speaker line at the TNC made it better. I also used toroid core inductors in the 3 wire RS232 line to keep that wire from being an antenna (tried that before trying the long cable between the radio and TNC, didn't help the radio much but reduced TVI from the TNC).

The cable that I used is marked "Inmac Clear Signal" which I had some of laying around. It's intended for some sort of computer use, but it works just fine for analog audio (mic and speaker lines). 3 twisted pairs with a foil shield over each pair. Grounded one wire of each pair. Any shielded wire should do.

My radio is crystal controlled, with one packet freq, so its being far away from the computer is not any inconvience.

BTW, my antenna is about 20 feet away from the radio, and something like 30 feet away from the TNC and computer. Don't forget to consider that in your station.

Hope this helps,
73 de WA2ISE

>As an outside observer, I see TAPR giving very unfair preference to Rakes
>and company based on personal relationships between Rakes and some of the
>board members.

Quite the contrary. There isn't much love lost between Ron and some members
of the board. As a whole, the board is quite impartial about this...

>We have no indication that
>the code he evaluated was even production code and not "ringer" code
>prepared for the purpose of discrediting Nord><Link.

This has been discussed at length on CIS. There have now been several
independent comparisons of Nord><Link and S2000 sources, all with about the
same conclusions. The TAPR board was afforded the opportunity for examination
of the code at our board meeting in Tucson in February. I glanced at the bits,
and was startled by the similarity of the one piece I studied, but admit the
remainder of my remarks are based on observations made by others whose
opinions I respect.

>Since TAPR (and now we) are sitting in judgement, it is our obligation to
>treat both sides fairly.

TAPR is *not* sitting in judgement. The fact of the matter is that we were
facing the choices of 1) leaving well enough alone and getting nuked by a
subset of hams for "supporting N/L", or 2) recalling the NNC (a project we had
cancelled anyway) and getting nuked by a subset of hams for "siding with Ron".
Damned if you do, damned if you don't.

>I'd expect
>Rakes to make his source available for public scrutiny especially since
>he claims the Nord><Link code is identical. Then I'd expect a verification
>to be made that the source released actually builds a binary identical
>to an independently acquired NET/ROM.

He has, and it has been done. End of argument on this point?

>My last concern is that TAPR has delivered yet another blow to the NNC.

>Nord><Link had the most potential of making the NNC practical and useful.
>Considering the money and time invested in the device, I'd expect
>support to be given to any effort.

There's such a thing as knowing when to cut your losses. TAPR decided at the board meeting a year and a half ago now that the NNC project was dead, and it was time to move on to bigger and better things. The microsat project, the DSP modem project, the 9600 baud radio modem project, etc., etc... That's why I commented in my last message in this string that it's all a pretty moot point. The NORD><LINK guys would have found a hardware-less market for any code written for the NNC anyway, since TAPR didn't intend to ever build any...

I'm going to address Dave's (aka Dr. Death) and Phil's comments in one posting, as they pertain to the same subject.

In article <8906260439.AA01569@toth.UUCP> (David B. Toth) writes:
>In response to John De Armond, WD4OQC:
>John: you are making wild and irresponsible statements.
>Ron Raikes and S2000 have no inside track with the TAPR BoD.
>In fact, we stated repeatedly that we were not a court of law

Boy the verbage streching over a year or so don't support that statement.

>and did not feel that it was our place to make a decision on
>this issue. In fact, we felt that it was for the community to decide
>based on clear facts, and not hysterical ravings by EITHER side.

The community HAS spoken by virtue of the almost complete replacement of NET/ROM with TheNet firmware. How much stronger can the community

speak?

>We sent NORD><LINK a copy of the WA6IGY analysis. We stated that the
>North American ham community had concerns re this issue and invited
>a reply.

My reply to that would have been a) you could hardly claim to speak for
the North American ham community and b) the fact that you had a priori
judged Raikes' consultants' report to be true on its face illustrates
extreme bias. I would not have replied directly to your allegations because
as framed, I could not give a "correct" answer.

They sent a reply. It did not speak to the questions that we
>had raised. Therefore, we asked for the return of the NNC, and have
>offered to cover their expenses.

I don't thinks expenses were the issue. The loan of the NNC was in
and of itself no big deal. Many of us could have done that. Pulling
it in the above context IS a big deal in my book. TAPR should have
stayed totally out of this debate.

>
>Now, the NNC was closed as a project in late 1987 (by me) since the
>people who had promised to write software hadn't (remember the caveat
>that you should only get one if you planned to write code). In addition
>we found that software tools were either expensive or non-existent.

Let's put some facts on the table here dave, since you claim credit for
killing the NNC. I had possesion of one of the development units here
in Atlanta for quite some time so I'm fairly intimate with the project.

The NNC was basicly a clone of the Micro Mint (circuit celler) SBC-180.
(not sure of the model #). It contained copied Micro Mint Bios ROMS
and ZCPR as the OS - again, I believe from the MM board. The release notes
left a serious doubt in our minds as to the legitimacy of the copied roms.
(shades of this discussion, no?) The major difference between the MM board
and NNC is the addition of an SCSI controller.

So we received a clone board with a cloned bios and a cloned OS (charitable
choice of words here.) Which meant that as far as a reproducable unit
went, we had bare boards. We could not rely on ANY rom or OS services.
We'd have had to start from scratch. A major hurdle but not fatal.
We pressed on, buying SLR's ASM-180 and Ecosoft C for development tools.
(NOT, by the way, excessivly expensive).

The next big revelation was that there was to be no software coordinator
at TAPR. The plan was for groups to go off into corners and write massive
ammounts of code, mostly duplicated low level routines, and TAPR would
bless the most successful. Well, I got a kick out of writing my first
couple of BIOSs but thrill was gone by the time the NNC came along. I
had little interest in wasting time duplicating the efforts of others.
But still not fatal.

So we start looking at applications. Phil had started pushing TCP/IP.
We were looking at something simpler, something that would probably have
evolved along the lines of NET/ROM. There was just one little problem.
Does anybody remember the mythical multi-I/O board promised by TAPR for
the NNC? The board that was to contain 4 modems and let us talk to
the outside world? Sure you do. You probably also remember promised
hard drive controller. Funny thing, these were never delivered.
We were supposed to write software for hardware that did not exist.

What we ended up with was a funky little clone CP/M box with little I/O
a bootleg BIOS and no ham application other than a terminal emulator.
Oh yeah, and a big dent in the pocketbook. At least I was lucky to only
be out the price of some tools and not the hardware.

So Dave, don't sit up there and point down on the software people as an
excuse for ending the NNC work. TAPR simply dropped the ball on this
one, pure and simple. The Georgia contingent may or may not have written
any useful code but we sure had a bunch of eager and capable people trying.

>
>So we asked for the NNC back because it was a matter of principle, since
>they had avoided our questions. This does not imply a decision on the
>part of the board as to who is right, and how right they are.
>

Funny how yanking a supposidly useless piece of hardware is presented
as not a decision as to who is right and who is wrong. Interesting
concept.

> (Me)..
>As an outside observer, I see TAPR giving very unfair preference to Rakes
>and company based on personal relationships between Rakes and some of the

Phil Sez...

>Those who have compared the versions have done exactly this -- verified that
>the NET/ROM source code provided by WA8DED compiles into object code
>matching that found in a legitimate NET/ROM EPROM.

I guess I must have a bit of Missouri blood in me because I want Raikes to "show me". If indeed the code is identical, Raikes has absolutely nothing to fear as there is nothing to disclose. Then the rest of us can take the code, compile it and compare it to NET/ROMS on the shelf to verify authenticity and only then compare it to the Nord><Link stuff. The ONLY reason I can think of for Raikes to not release his code is that he is hiding something. (That may not be an 100% fair statement but it's as fair as TAPR's response to Nord><Link's "lack of response").

Even if the code is 99% alike, I have no problem as long as no one stole source from Raikes. I don't believe Raikes ever claimed that. I (and apparently a lot of others including the courts in the few applicable cases) consider reverse engineering to be a legitimate development activity. Assembler, maybe not. But C is another story. I maintain that strict decompilation of an optimized binary is not practical. Those that cite the Internet worm as a counterexample should remember that the worm had not been stripped and contained much runtime library code. Both make decompilation much easier.

I COULD anticipate someone sitting down with a compiler and didling original code until the compiler emitted nearly identical binaries. I'd then expect both sets of sources to be alike. I doubt that anyone could claim infringment on that basis. Certainly not worth the massive abuse aimed at Nord><Link. That they may have done such a thing may stretch credibility for some of us who have computing centers in our homes but it is not at all unreasonable for someone of limited resources and a purely hobby level interest to have done so.

(ME)...
>My last concern is that TAPR has delivered yet another blow to the NNC.

And Phil sez...
>
>The NNC was already, for all intents and purposes, dead well before
>NORD><LINK asked to borrow one. The design is completely inadequate for
>serious packet switching use, despite the relatively high cost. (In my
>opinion, TNC-2s are also completely inadequate for serious packet switching.
>But they are considerably cheaper than NNCs.)

This attitude bothers me. The NNC with Nord><Link code on it would fill many networking needs for the majority of the ham groups who can neither afford the cost of higher speed nor find space for the equipment. The NNC, perhaps with a little crystal goosing, could very adequately handle multiport switching at 9600 baud or below. I presume the Nord><Link guys would have been supplying the mythical modem boards as part of the development effort.

Besides the potential for being cheap, the NNC would fit many places
a PC and faster RF hardware would not. I know of many sites available
to us here where a nicely packaged NNC and RF gear on 2 meters or 440 could
be unobstrusivly placed. A rackfull of gear like our high speed switch
occupies would be out of the question. I could much easily fit a few
2 meter or 440 yagis which look like the rest of the antennas on the
tower. It would be quite another thing to justify a microwave dish or a
long boom yagi to the site manager. And consider that most of us who don't
have a research lab or 2-way shop at our disposal have test equipment
that is perfectly adequate up to about 500 mhz. I could never justify
the money necessary to buy microwave test equipment even at hamfest
prices (at least the ones I've seen.)

The PS-186 from SANDPAC is
>the machine you really want (if you want a dedicated hardware engine in the
>first place, that is) and I think it will assume the role originally
>intended for the NNC. N3EUA is already porting the KA9Q TCP/IP package
>(including W9NK's independently developed NET/ROM code) to it. In the
>meantime, lots of us are using stripped PCs as IP (and NET/ROM) packet
>switches, and they work great.
>

Well remember which group started and pushed the concept of PCs on
mountaintops. (if you guessed GRAPES, you'd be right on the money) I
remember when I was severely chastized on the net for suggesting a
PC with a hard drive on a mountaintop (they work just fine, probably
tougher than the PC). I remember when the concept of a PC as a
switch was dismissed as a "toy" idea. I remember how long it took to
get KE4ZV's digipeater code incorporated into a release of net and how much
time it took to backfit each release.

So yes, we know a bit about PCs as switches. We also know that a 4 port
switch occupies a full height 19" rack, the space for which is unavailable
at most sites. The NNC combo would do a nice job for these sites.

I know that a lot of work is going into your code, the PS-186, Bdales
ehternet over microwave and such. I'm very interested in experimenting
with all these goodies but what I bolt to the top of a mountain is a
whole 'nuther matter. I must have something that is reliable, reproducable,
replaceable, affordable, and preferably, already built. The time I
spend driving up to mountaintops to fix flakey hardware is time away from
the fun.

>As for the TheNet-vs-NET/ROM controversy, this topic has totally consumed
>the HAMNET forum on Compuserve for at least the past six months. I do not
>want to see it happen here as well. Before commenting on this topic, I
>strongly suggest that everyone go read the volumnous record of comparisons
>and articles that have already been written.
>
>Phil
>

Well, I got tired of feeding CompuServ about a year ago so I've not
seen the discussion though I can anticipate most threads. I feel that
the issue of Nord><Link and particularly the issue of TAPR's actions
toward them are too important to dismiss. We may eat up bandwidth
and we may only change a few peoples' minds but the effort is worth it.
I mean no personal malice toward anybody on this net but sometimes
feelings get hurt. To that problem, I can only say I'm sorry. These
issues are a personal culmination of several years worth of exasperation
that have finally come to a head.

Lastly, I appoligize for the length of this posting but there were many
issues to address. I guess it's lucky I'm doing this at 3:00 am and getting
tired :-)

John

    I am unsure of the newsgroup to post this to, so I
    am posting to several in hope of an answer.

    How does one go about determining whether one can receive
    satellite broadcast at a given location (for example :
    16 27'00", 28 28'00" the geographic coordinates for
    El Sauzel, Tenerife, Canarias Islands.)

I would like to be able to pick-up European and American
television Broadcast signals.

Thanks in advance.

>>Well, I'm diametrically opposed to the position taken by TAPR and Phil.
>>I think TAPR has lost a lot of credibility in this move.
>
>John, for someone who normally strikes me as being extremely well informed, and
>bearing opinions that are quite objective, your reaction mystifies me... the

Fair question. Let me expand on this a bit. I have tried to filter the BS
from the facts in this discussion. Admitedly the noise-to-signal ratio
has been high on most forums. There are several things in this world that
hit my "go button". Among them, exploitation of the public trust and good
will, dishonesty, allowing hobby disputes to leak over into the professional
world and copy protection.

NET/ROM / Software 2000/ Raikes' behavior has touched on just about all of
these. When NET/ROM first came out in beta form as no-cost software,
I thought it was great. Here was a transport protocol that fit into the
hardware and operating environment most hams are familiar with. After
all, there are many more node administrators who are NOT technical whizes
than those who are. I saw some limitations but none that could not
be rounded out. I have a bias against any ham-oriented software (ham or
commercial) that does not include source. I still believe in ham radio's
charter if education. I can think of no better way to educate a ham
about an application than to have him study the specification AND
an implementation. So I had reservations about the object-only distribution
and expressed an opinion to that effect.

Then we found out that the intent was to get hams to beta test and debug
the code for free and then turn it into a commercial product. That is
the exploitation part. Here he is using a publicly developed protocol,
publicly refined hardware and publicly developed operating practices to
base a rather high priced product on. A product whose details and design
were "proprietary" - remember that he only released the protocol specifications
very much later. Then he obtains free beta testing and bug reporting by
seeding the community with free beta copies and not disclosure that followup
releases would be commercial. To cap things off, we then find that he is also
selling a pure commercial (non-ham) version into the RCC market.

I realize that nothing here is illegal or even a particular exception to
common practice in the software industry. I consider it unethical, however,
and unbecomming to ham radio - I have always, after all, considered hams to
be a cut above the general population.

Then the kicker comes. He's encrypting callsigns into the ROMs and worse,
charging almost full price for call sign changes. Copy protection. Copy
protection is a particularly insidious crime in my book. Its very nature
says that any user is a priori a criminal against which guardian measures
must be used. So he's misappropriated the good will of the ham community
and he's rewarded it by calling us all thieves and ripping us off.

Some would say "you don't like it, don't buy it". Good advice but not
particularly applicable here. Those people who had significant investment
in equipment at switch sites could not simply dump that investment.
Remember that at that time there was nothing to replace it. Of course

network architecture could have been altered to work around it but why should we pay the price for his greed?

In Georgia, sufficient anger arose that GRAPES took an official position against NET/ROM. We would not sponsor a NET/ROM site nor interconnect with one. And we encouraged affiliated sysops to refuse connections routed through NET/ROM. I was angry enough to investigate his copy protection scheme and figured out how to change the callsign (as did several others) and made the information public. No longer would he rip off people for call-sign chages.

So then along comes Nord><Link. A bunch of German hams publish a public domain clone of net/rom. Complete with source... and support tools. and some enhancements. Neet stuff. So what does Raikes do? He goes totally and completely bonkers. I have rarely in my life see such caustic, such venomous, such hateful words as were written by Raikes. Rather than pressing an infringement case, he resorted to slander and character assasination in the public forum - a forum the germans could ill compete in. Factors such as the language barrier and access to american networks worked against the germans. Besides as we all know, it is very hard to prove a negative.

And to top that off, he tries to ruin anyone who used Nord><Link. Witness the JPL and several documented instances where he contacted supervisors or company officials of those using Nord><Link. This is way beyond any stretch of the ethical imagination. To affect someone's career over a ham radio dispute is just plain stupid. I can't imagine how anybody could have sided with him at this point regardless of their prior opinions.

And then he releases an "upgrade" with an intentional protocol incompatibility designed to obsolete the entire installed base of net/rom protocol sites. By then even the most ardent net/rom supporters had had enouth. By then the transition to Nord><Link in this area was complete.

So having failed to win his case in the public forum and knowing he did not have a legal chance, he goes to the TAPR board. He presents his "independent" consultant's report. Then TAPR in effect demanded Nord><Link prove a negative. I'm not sure just what response would have been "right" at this point.

The best thing TAPR could have done was stay neutral. They did not and instead took sides. That is the basis of my criticism. Especially since this action effectively snuffed out any hope of there being an application of the NNC. (No need to hash that one over again).

It really does not matter to me whether the nord><Link group decompiled a net/rom or whether they twiddled original code til the objects looked like net/rom or whether an incredible coincidence took place. As long as they did not steal source or design documents from Raikes, I have no problem. As I've stated before, I consider reverse engineering to be a viable enterprise especially when the clone is "constrained by the architecture" to use the judge's words in the Intel-NEC suit.

I maintain that if there had been a shred of legal evidence to support
his claim, Raikes should have been in court. Contrary to popular
opinion, and injuction against copying or distribution is very
inexpensive to obtain especially when no monitary bond is involved.
I know, I've done it before. He'd have spent maybe 5-600 bux on fees.
Now an injuction of this sort would have been impossible to enforce but
it would have delivered a powerful message to the community. If I had
seen a notice of injunctive relief, I'd have certainly given the matter
a reconsideration. I'd probably not have used either set.

>>And now TAPR unilaterally decides to discontinue distribution of NORD><LINK?
>>I am deeply disappointed.
>
>TAPR never distributed any NORD><LINK software, so there was nothing to
>discontinue.

My comment here was based on an announcement I saw go across the BBS net
at one point that the sources were available from TAPR. I stand corrected.

>I hope this helps to clear up some of the misinformation. Regardless, as TAPR
>President Andy Freeborn N0CCZ so eloquently put it, "I sure hope we can get
>back to work now". TAPR is, after all, primarily an R&D organization...

Well I hope so too, although this discussion must take place after TAPR
injected themselves into the political arena. BTW, we gonna ever see
some TNC-2 sources????? :-)

At the risk of prolonging this flamefest, I can't help but wonder
what your definition of "public" is in this context. I've never heard
anyone question whether the NET/ROM protocols themselves were originally
developed by Software 2000.

>Then he obtains free beta testing and bug reporting by

Wow! Lets string him up by the thumbs!
Am I missing something here, or did it suddenly become a crime to make money
in this country? You'd probably be *really* upset to discover that ICOM is
also selling radios into the aviation and marine markets.

>I realize that nothing here is illegal or even a particular exception to
>common practice in the software industry.

I think that pretty well sums it up.

Well, this seems to me to be the nub of the issue:

In article <5438@stiatl.UUCP> john@stiatl.UUCP (John DeArmond) writes:
>It really does not matter to me whether the nord><Link group decompiled
>a net/rom or whether they twiddled original code til the objects looked

>as they did not steal source or design documents from Raikes, I have
>no problem.

If you really believe that, John, then what, if anything, do you
think the copyright laws mean? Can I take your professional work
output and copy it freely? I don't know whether your product is
hardware or software or both. Mine is both. I don't believe
that anyone can just copy it, decompile it and give it away.
Whether it's yours, mine or WA8DED's. And yes, I've manually
decompiled bigger pieces of code than NET/ROM, but I haven't
given the results away. I HAVE given away some of my code, to
the KA9Q effort for example, but that was my choice, not some
thief's.

Or is it just because you don't like WA8DED's behavior that it's OK
to steal his property? (I won't try to defend what he did AFTER
it was stolen -- JPL, et al. -- but that's irrelevant to the theft
of his code.) What if someone didn't like your behavior, or mine?

> As I've stated before, I consider reverse engineering to
>be a viable enterprise especially when the clone is "constrained by
>the architecture" to use the judge's words in the Intel-NEC suit.

Z80-SIO routines are rather constrained. Not the NET/ROM protocol
implementation.

>Z80-SIO routines are rather constrained. Not the NET/ROM protocol
>implementation.

On this point I think I can speak with some authority. I have not seen any of WA8DED's code, so I can't judge similarities between NET/ROM and TheNET. However, I am quite familiar with the transport protocol implementation in TheNET, and I wrote both the network and transport protocols for the NET/ROM support in the KA9Q NET package. Based on this experience I would like to make the following points:

1) The transport implementation in TheNET is very distinctive. The ways in which it allocates and uses buffers, sequences groups of packets into windows, and deals with timers are, when combined in an implementation, something I would certainly consider an "original work". We are not talking look-and-feel here. If it can be credibly and independently verified that the algorithms and data structures used in NET/ROM are the same or substantially similar, then I have no trouble with the notion that copyright has been violated.

2) Protocols are not microprocessors. There are many, many ways to implement a protocol; in fact given a spec (such as the one for TCP) there are large areas where the implementor has considerable scope for creativity. Anyone who has access to my NET/ROM code and Nord><Link's should find virtually no similarity between them. The basic transport frame type switching logic is different, as is the way I handle timers, as is the way I handle the connection establishment and shutdown phases. As I've mentioned before, the basic communications portion of the implementation is modeled after the sliding windows protocol in Tanenbaum's 'Computer Networks'. There are some basic constraints on the data model for the routing table that make aspects of the network implementation familiar, but these are precisely the kinds of things that are not easily claimed as an "original work". I can't accept the comparison between this and the NEC case.

3) NET/ROM is really a dumb product, and you have to be pretty dumb to want to copy it. The idea of a radio transport protocol with fixed frame timeout intervals is ludicrous (that's something I fixed in my implementation, *without* loss of compatibility with the protocol, I should point out), and the Bellman-Ford routing algorithm in the network layer is almost totally useless in topologies that do not resemble a straight line. The Nord><Link people didn't do anything except delay the introduction of quality network services into the ham radio community. If Software 2000 can sell this junk to commercial customers, more power to them. We as hams should be able to do better than to plug `n play some knock-off of a bad product. While I think Raikes showed a callous disregard for the effects his actions would have on the wider ham community, I also think that the people who used TheNET in the face of his concerns have to share the blame for what ultimately happened.

-- Dan Frank, W9NK

A new mailing list aimed primarily at the application of Digital Signal Processing technology and algorithms to amateur (and other) communications has been recently started. If you are interested in DSP-related topics, or feel you may be able to contribute to discussions held on this new DSP mailing list, send your name, callsign (if any), and a valid E-mail address to:

dsp-group-request@ka7axd.wv.tek.com, or
dsp-group-request%ka7axd.wv.tek.com@relay.cs.net, or
...{backbone}!uunet!ka7axd.wv.tek.com!dsp-group-request

To post messages to the group, send them to:

dsp-group@ka7axd.wv.tek.com

or appropriate permutation as shown above. If a sufficiently large number of people in your area are interested in subscribing, I would suggest that you setup a redistribution point (see your system administrator if you need more information).

If you have any questions or comments about the dsp-group, please send them directly to me at the email address below. Enjoy!

Mike

Hello All,

I need some infomation on the KISS mode for the Pac-comm TINY 2 TNC.
If anyone has this on file could they (e)mail it to me, unfortunately
we have no Internet connections so anonymous FTP etc is out of the
question.

May I also repeat my previous request for information regarding West
German Mailbox network.

Thanks & 73,

Mike - G6DHU

>Oh... disregard my last question.

If someone sells a product that is deliberately crippled in some way, I have
NO problem with improving/enhancing/fixing it. The product WAS paid for,
after all. The concept of 'pig in a poke - and you get no promise that it
does what you want' seems to be particularly a software sales issue. When I
got a Unix system with non-working utilities did the distributor care? No.
Did the manufacturer care? No, there was no claim that it worked in the
license agreement. Did AT&T care? No, they got their license fee. Was it
"legal" to reverse engineer (i.e. decompile) and fix the thing? No.

Tough. If someone wants to sue me for making a purchased product work
correctly.. let them try. In my opinion, copy protection and such things
as Call Sign encryption fall into this category. If I paid for the thing, I
get to "fix" it if it breaks. [I am not advocating stealing software].

I am a host-based UNIX user in the St. Louis MO area. I know nothing
about packet radio. An old friend who lives in the Dallas, TX area
recently gave me some info about his packet radio ID/address (?)
and said he thought we might be able to "gateway" somehow for
electronic mail. He is a packet radio enthusiast with an ID on a
packet BBS, but knows nothing about the UNIX side of things.

I would appreciate it if anyone can tell me how to get from INET
or UUCP to packet radio BBS nodes and back. This has probably
been covered on this newsgroup and is boring to trivial, so please
just reply to me via e-mail.

Thanks in advance!

I'd like to toss this out to all the readers of TheNet // NET/ROM

discussion...

Everything that you know, you know by hearsay, unless you are one of the privileged few and even those people are subject to review.

In a real court of law it would be inadmissible. There are reasons that we have courts and judges vice convictions by mailed ballots after reading newspaper and magazine accounts. Would YOU like to be judged like this?

You and I are entitled to our opinions. However you nor I are entitled to tell the other person he is right or wrong based on hearsay.

If you tried to coerce me into using NET/ROM (or TheNet) based on hearsay I'd tell you to take a flying leap and I'd tell the ARRL, 73 magazine or my next door neighbor the same thing.

The ONLY way to settle this is in a court of law.... period. To say R. Raikes shouldn't have to use our courts because he didn't make enough profit is one for the books!

If I think that you stole my lawnmower I will call the police, not your employer. I will let the judge decide, not the people who live on my street. And before I accuse you, I will be darn sure that I know what I'm doing, because anything less would be libelous and I would be held accountable for it.

The present discussion on this issue violates ALL of the above premises and as such how can I take action based on anything less than a court decision? To do so would be in contradiction to all that I believe.

Do not stand in judgment of me, Nord><Link, or R. Raikes unless you have personal experience somewhere along the line. Failing that, trust the courts since that is what they are there for. If there happens to be an expert programmer with access to all source code and also a Copyright lawyer on this net, speak now. Even then I forgot to mention QUALIFIED UNBIASED JUDGE! You see a court of law puts all these things together at once, this net does not.

The question of theft or Copyright infringement will NEVER be settled out of court... NEVER!

If we as hams are going to stand in judgment of other hams, let's start by cleaning up the vulgar language on 75 meters, or the jamming on 20 meters, these are things we have FIRST HAND experience with. Let's leave the matter of Copyright Law where it belongs... in a United States Court of Law. This matter is going WAY past "self-policing" and is getting really close to a vigilante committee.

Mark Bitterlich /\ The opinions expressed herein are my own,
WA3JPY WB4UOU \/ but I also believe that they should be yours.

on the net, so please remove any extra CR/LF if this comes out

double-spaced. Be sure to preserve the BID$.

SB ALL @ ALLUSA $KT7HFC01

Sharree Marshall's FCC Appointment

7/5/89

Sharree Marshall's FCC Appointment

Bulletin ID: KT7HFC01

Several bulletins regarding Sharree Marshall's appointment to the FCC have

been going around in the past few days, and I wanted to clear up some

mis-information in these messages.

First, Sharree Marshall's name has been withdrawn by President Bush as a nominee for the Chairman's position on the FCC. She is still one of his choices for the three vacant commissioner positions. The new nominee is Al Sykes, head of the NTIA. Her name was probably withdrawn for political reasons relating to her work with former chairman Dennis Patrick, whom the Senate Communications Subcommittee did not like, and also because she assisted the White House in the failed nomination of John Tower for Defense Secretary.

Second, Ms. Marshall is NOT an employee of UPS, as a recent bulletin and sample "letter to Congress" circulated via packet stated. She is an employee of a law firm specializing in telecommunications law, and UPS is one of the firm's many clients.

Third, Congress is not the place to address your input on this matter. The FCC is governed by the Communications Subcommittee of the Senate Commerce, Science, and Transportation Committee. Here are the senators who are members of the subcommittee needing your input on choosing FCC commissioners:

Inouye	Hawaii	(Chairman, Communications Subcommittee)
Hollings	South Carolina	(Chairman, Commerce, Sc. & Trans. Comm.
Ford	Kentucky	
Gore	Tennessee	
Exon	Nebraska	

Kerry	Maine
Bentsen	Texas
Breaux	Louisiana
McCain	Arizona
Stevens	Alaska
Pressler	South Dakota
Packwood	Oregon
Gorton	Washington
Burns	Montana

Address each piece of mail to an individual senator at:

(Senator's Name)
U.S. Senate
Washington, DC 20510

Do not try to use their individual office number. Right now a lot of them are changing offices, and the address above is best.

Keep your letter to the point, leave out any long harangues, and use a spelling checker if you have one. Don't accuse Ms. Marshall of doing anything wrong UNLESS YOU HAVE SPECIFIC EVIDENCE. Wild allegations do not help our cause. A suggestion that she may not possess the objectivity to regulate ham frequencies in the public interest may be sufficient.

I will forward more information as I get it. Hams in the states served by

the above individual senators can have an especially strong impact.

The subcommittee staffer I spoke with today said that they will try to have the hearings underway before the end of July. If they miss that date, then it will be after the recess and in the fall.

Fire up those word processors, but remember that a well thought out letter from an individual has a real impact. If a senator gets a bunch of identical form letters, it is a negative for us.

Good luck!

73,

Tad Cook

re: TAPR statements on the NNC project

E-mail seems to be really unreliable and error prone - or why do the statements given by some TAPR official not match the letters on file here? So here is the story once again (shortform). Please note the uncertainties here and there. We had difficulties to decide what was official and what was not. Local customs are sometimes hard to understand, even if you spend 25% of your time in the US.

1. Once there was a letter from Tucson to NORD><LINK asking us to put TheNet on the NNC. We discussed that and decided to go that way, knowing that the hardware was old and not the best possible. But it was (as we thougth at that time) tested and ready stuff, documented as it should be.

2. We visited some folks in Tucson and discussed the whole matter for some hours. This included a lengthy statement on how and why TheNet was done. Anyway, it was a nice and interesting evening.

3. As a result of all this we sent a letter to TAPR and after some opposing statements of TAPR officials in E-mail (and a very upset second letter from us) it officially arrived in Tucson. This letter stated the conditions under which we would put TheNet to the NNC. TAPR agreed in writing and we had to fill in a form to get the NNC board.

4. Then the NNC showed up here, accompanied by 2 disk drives which we had told them we didn't need. And we payed duties on the NNC board (little) and on the disk drives (much). And just that amount we payed for the drives TAPR offered to refund us (but we said no, because the bank would get too much money off that). By the way, the documentation that came along with the NNC was rather poor. When we shipped back that stuff we included a copy of our local made, better drawings (if you need a copy, tell us).

5. Later a modem board came along (after we requested it) without any documentation (and no duties to pay on that, it was declared as a gift). Don't care, a real engineer doesn't need any documentation, it only leads to confusion.

6. Our intention was to release the first software by july this year (TAPR knows that date since last summer). But our statements made last year are read different in Tucson this year. So it is the end of the story. Sorry for some folks over there. But you only have to wait a short time, the TNC-3 will be ready soon (from NORD><LINK and public domain, what else?).

73, Georg, DF2AU @ DK0MAV, Chairman NORD><LINK

re: Phil Karn's cloning procedures

What we did and the way we did it is perfectly legal here in Germany
and we doubt if it is illegal in US, but I am no expert on that. I
don't know what type of company Phil Karn is working for but from my
experiences as a freelancer with european and US companies he is
somewhat wrong. The US version of cloning is to hire the best man of
the competitor and give him the most tainted men available for help
(anybody need examples for that from history?). The european version is
more a reverse engineering (mostly because here it is harder to make
someone leave his company). All you cloning experts over there, don't
make fools of yourselves, try to be a little honest, even if it is
hard.

>>Isn't there some kind of clause that says that if you purchase software
>>for your own use, you are allowed to change that software (i.e. decompile,
>>reverse-engineer, or whatever) as long as the product is not re-released
>>or resold?

dan%speedy.wisc.edu@speedy.wisc.edu (Dan Frank) replies:

>Most licenses I've seen explicitly disallow any form of reverse engineering
>or decompilation.

My fault, I did not say this very well. What I was referring to was a
federal ruling that addressed the modification of purchased software,
the modification being for your own use or entertainment only. The
ruling would be held in precedence over any licensing agreement.

>   The universe of options is not closed. You are not restricted to
>(a) running bad but legit NET/ROM, or (b) running illegitimate knock-
>offs of NET/ROM, which you seem to feel are somehow technically

>superior. Here, for your edification, are a few more possibilities:

Dan... I don't feel TheNet is 'technically superior' and I never used
words to that effect. What TheNet did offer me was:

1. A version that fixed all the bugs for free that I had paid to
get from NET/ROM.
2. A "convers node" that allowed group conferencing similar to
packet cluster.
3. A backbone version with sysop validation of callsigns.
4. A few extra features that I used. (2 remote control functions and a
node 'info' feature.

>   (c) Write your own NET/ROM.

Easy for you to say. (YOU DID DO THAT! And my hat is off to you!!!!)
Unfortunately the simple fact is that I have neither your talent or
ability which I admit is a pretty lame excuse!   :-)

>   (d) Take my NET/ROM code, which is much better than the junk being
>   propagated by Raikes, Nord><Link, et al, and port it to your
>   favorite platform. The copyright notice on my code says that
>   it may be used in any form for non-commercial purposes
>   as long as proper attribution is given. That means you could
>   add NET/ROM transport to your BBS system, or build your own
>   node, and give either away for free.

Agreed.... thanks.

>   (e) Stop using bad protocols (even my implementation is constrained
>   by how bad NET/ROM protocols are), and try something else. If
>   you feel that the only kind of networking you could ever do
>   involves inadequate, outmoded hardware (i.e. TNC-2s), get the
>   excellent ROSE switch ROMs and throw away all those buggy
>   Software 2000 products you are complaining about. Or, if you are
>   open minded about hardware, run Phil's TCP/IP package, or
>   develop something of your own.

I do run Phil's package and love it, however a network requires
'more than one' and getting everybody and his brother to go switcho
chango over to tcp/ip is easier said than done. ROSE sounds viable.
However ROSE was one very big mess here a few years ago with "yes
it's available .... er ... no it's not ... er ... yes it is... er...
call us back in 2 months". That's why NET/ROM took off to begin with
(in this area anyway). However your suggestion is a good one, thanks.

>   As to the copyright issue:
>   What should Company L. do? If it doesn't move to protect its
>copyright, it is possible for that copyright to lose its validity.

This includes calling people's employers in such a way as to cause
them professional embarrassment when they are simply a USER and not
the DEVELOPER? Sorry Dan, I hear what you're saying but since this

was thrown into the public forum you have to judge morals and ethics
along with legalities.... or I should say that I CHOOSE to do so.
Ask yourself this question. Has R. Raikes helped or hurt packet radio
or amateur radio in general? Now take Nord><Link, say what you will
about them, I believe that their hearts were always in the right place
regardless of the outcome, and this assumes that everything bad said
about them is true. So being that this IS NOT a court of law and seeing
that I can choose who I support based on 'how I feel' about the players
involved.... R. Raikes loses.

>Contrary to previous
>postings, that action does *not* have to be in court: Xerox spends
>a lot of money on apparently silly ads saying, "Xerox is *not* a
>generic term for photocopy machines!" Given his lack of deep pockets,
>it should come as no surprise that Mr. Raikes chose informal means to
>try and protect his copyright.

No it does not have to be a court action. If the best interests of
Amateur Radio were considered it probably SHOULD HAVE BEEN a court
action, but given that the only consideration of R. Raikes IS the
depth of his pockets then I agree... it was no surprise.

>The copyright protects only the expression of the idea; it does not
>guarantee fitness for use.

Hmmm, so then I can sue HIM for false advertising? :-)

Seriously though... let's consider this. NET/ROM was all there was
for a little while. People bought and used it, then a lot of us switched
to TheNet because it was free and it offered more options. Now there
are even more options available, however they are NOT AS EASY to get
going YET, (with ROSE being a possible exception). Call me timid, but
I hesitate putting a PC with hard drive on a 2000 foot tower in a box
that is not temperature controlled that I can't get to without massive
scheduling. Putting a TAPR 9600 baud radio modem in there with some
kind of TNC controlling it is a little easier for me to pull off right
now. Not all of us have natural made towers (mountains) with nice little
temperature controlled huts to put this stuff in. Mountain tops are bad
enough... 2000 foot towers are at least as bad or possibly worse!
(Think about an ice storm....and what happens when it starts to MELT.
Dropping a 30 lb. piece of ice on a cabinet from a few thousand feet
up is not covered in the warranty :-)

There are three types of packet people in the world today:
1. Those that DEVELOP the "new stuff".
2. Those that IMPLEMENT the "new stuff".
3. Those that USE the "new stuff".

You are a number 1, I am a number 2. This whole issue with TheNet and
NET/ROM is soon to become moot anyway. In just a few months I am told
that there will be whole new ways (much better) of doing "things". Faster,
smaller, more capable. There is no need to murder TheNet and NET/ROM, just
let it die a natural death like AM on 20 meters. Packet technology is

changing so fast that by the time "the world" comes to a decision on
who did what to whom, it'll be too late anyway.

The only reason I opened my big mouth was because I saw people with very
respectable backgrounds offering their points of view from a purely legal
standpoint, but they carefully avoided the more 'seedy' factors involved.

The thing about a 'public forum' is that there are no rules of evidence,
there are no qualifications for witnesses, you can alter, twist or simply
lie about the facts or just make up some of your own. There are no winners,
just survivors. I apologize for continuing this mess ... really.

Flames will be humbly accepted. Well.... 'gracefully' accepted anyway! :-)

A lot of packet radio link layer work was done for DARPA. Essentially, they
had a datagram protocol like IP (actually it did transmit IP datagrams) but
instead of embedding them in AX.25, it had its own protocol. The protocols
are well documented, and I can look up some of the references if you would
like.

They used different access methods, spread spectrum code division multiple
access with convolutional coding error detection and correction, and they
ran at much higher speeds (than 1200 bps), like 100 kbps. They actually
built some medium sized networks that worked, and the last stuff I saw
published was on how to deal with larger networks. Either the effort has
stopped or gone classified, because I have not seen anything much in journals
for the last year or so.

I have 4 each 8K ram expansion modules for the Model 100.
I'm told they cost $50 each if you can find them.
I'll sell all 4 for $100. Or make an offer on fewer.

NONSENSE.

This statement is TOTALLY unrelated to the issue. The programmers of
this "clone" have already as much as admitted that they disassembled
and analyzed the NET/ROM code, line by line.

Anyone who has been around the development of an IBM PC "clone" can
tell you that it's a completely different animal. The companies that
"clone" PC BIOS ROMs go to SERIOUS lengths to ensure that the reverse
engineering is done without reference to the original source code.

For example, managers of one BIOS clone project that I am aware of
refused to hire programmers with *any* PC experience of any kind.
In addition, all the programmers signed legal documents agreeing
not to make reference to the published BIOS ROM code, etc.

The most interesting part of the story is that some of the work on
this same machine was done "offshore" in, uh, err, an Asian country.
The developers there didn't have quite the same scruples. IBM
analyzed the product, caught them at it, and took successful
legal action to prevent the machine from being marketed in the US.
The manufacture was forced to withdraw the machine from the market
for re-engineering on the copied portion. The delay knocked the
machine out of a preeminent position in the marketplace and into
historical obscurity.

This is a brief guide for the beginning packeteer. This should help him
make some sense of what he sees on the air just after getting his computer,

TNC and rig set up correctly. It describes some beginner's errors (some that I made, and I figure that these are somewhat common). Nothing worse than being a newcomer who ends up annoying unnecessarly the other users :-)

Packet Beginner's Guide V1.0   wa2ise

Let's assume that you have set up a packet station and you have verified that it is working. And you have monitored a packet channel and seen various beacons and people connecting to BBS's and stuff.

Probably the first thing to do is to find the nearest major BBS. These should be easy to identify, as they send a long preamble with the name of a club and maybe mention of the ARRL. In north NJ, they have a -4 at the end of the call (this is called the SSID). You'll need to find a favorite board to call it your "home" BBS. Connect to it for the first time and it will ask you to supply your name and your "home" BBS call. It should tell you what command and syntax it expects you to use. If you goof up, the BBS should respond by telling you how to get a help message.

The next interesting thing to do is to send some mail to a friend. You'll need to know his call and you need to know what his home BBS is. You'll have to ask him for that. To start, type MAIL <call>@<his home BBS> Then the board will ask for a title of the message you are going to send. It expects just a few words. After that, you'll be told to type in the message and to end it by typing CONTROL Z or /EX on a line by itself. That sends it on its way. Similary, you can post a public bullitin by doing SB ALL (just be sure it's worth reading). You can get a list of bullitins by typing L. Read one by typing R <number>. Don't stay on a BBS too long (1/4 hour max) as others will want to get on it.

Do not confuse a personal or private BBS with the big BBS's. The private BBS's are just personal packet mailboxes, for the owner's personal use (these have -15 SSID's). Do not post public bullitins on a personal BBS! You can leave a message for the owner on his board, but only for him.

Nodes and Digipeaters: The basic difference between these is that a node sends back to you an acknowledgement that it heard you ok before it relays the message to the destination, while the digipeater just relays the message and it is up to the destination to send back thru the digi the acknowledgement. The node makes a better path. But don't use nodes or digis unless you have to, as the repeating eats up time that other people could use on a crowded freq. You can identify a node when you are connected to one by typing "?". It will come back with a line of stuff including "nodes" and "parms". If you then type "nodes", you'll get a list of other nodes it can link to. Some nodes can connect you to something on another frequency. A digi will just sit and not do much if you connect to it and nothing else.

About Beacons: You should resist the temtation to use your

beacon. It will only clutter the freq, and annoy other users.
Only public BBSs, nodes and digis have a need to beacon.

hope this helps. This is public domain, use it, modify it, add to it,
(correct it :-)), distribute it if you want.

ALL ARE INVITED TO JOIN A
>>>>>NEW SHORT WAVE LISTENERS ELECTRONIC MAILING LIST<<<<<

WHAT IS SWL-L?

Now there is a medium which SWLers can use to trade information on:

- Frequency lists (for all modes, all frequencies)
- Projects (homebrew, from simple to complex)
- Ask questions about:
  - Monitoring
  - Radios
  - Antennas
  - Listening conditions
  - RFI
  - etc.
- Learning!

I have been reading rec.ham-radio(.packet/INFO-HAMS) for 3 years.
While I have learned a great deal from reading this list, I feel it is
important to the SWLing community to have its "own place." There have been
some SWL related articles, which are welcomed by these Ham forums, yet I

have not found a dedicated SWL related information base.

Now, there exists such a medium here. There is a new listener's group set up via LISTSERV here at Columbia University

Now SWLers can subscribe to a list which will be mailed to them which will contain items of interest including, but not limited to the above topic areas. You can receive frequencies FAST. How would you like to find out the utility frequencies for an emergency situation within hours (not days like it takes some Usenet messages to be sent and replied to via the net, or MONTHS for magazines!). How about talking about projects you are working on, antennas or radio problems? Many, many issues can be discussed. I hope you will subscribe to the list, and if you do PLEASE POST!

HOW DO I GET ON THE LIST?

Just like any Bitnet listserver list you may subscribe to the SWL-L list here at Columbia University.

INSTRUCTIONS:

1) if you're sending from a BITNET node, you can say:
(CMS) tell listserv at cuvmb subscribe swl-l your name here
(VMS) send listserv@cuvmb subscribe swl-l your name here

2) if you're sending from an internet site, or a UUCP site, do the following:
a) send a letter to listserv@cuvmb.cc.columbia.edu -or-
rutgers!columbia!cuvmb.cc.columbia.edu!listserv
b) the first line of the body of the letter should read:
subscribe swl-l your names here.

3) You will receive a letter of confirmation. In this letter you will find out more information about listservers and bitnet file servers.

4) To post to the list send mail to SWL-L@cuvmb with your subject and letter. This letter will be echoed to all members of the List.

5) There is also a file server availiable. You may get a listing of the files in the file server (currently there are none) by sending a command to listserv (addressed in the same manner as you used to sign on the list). The command will be the body of the letter. The command for a directory listing is:

```
get swl-l filelist
```

You may request a specific file by sending a command (to listserv) which says:

```
get filename filetype
```

as listed in the filelist.

REMEMBER!
---

send COMMANDS to Listserv@cuvmb
send LETTERS to SWL-L@cuvmb

Sign up and have fun!

>Z-80s are now about 13 years old and hopelessly out of date. It seems
>quite clear that we need to get rid of the TNC as a separate box and
I tend to think the opposite.

While a TNC operating at 1200 baud could be run as software in a general
purpose computer, the faster you go the more expensive such a machine would
have to be. A TNC is a specialized device, and could very well use a
specialized if less powerful processor that would be cheaper. Why do
that stuff that an HDLC chip would do in software?

The updating should be in the speed and error correcting abilities of the
TNCs, so that they can be used by the general purpose computer for things
such as NFS and the like. Or by a terminal so as to be able to use a
remote host.

BTW A number of years ago, tandy had a portable terminal. It was a keyboard,

a modem, and some sort of display or printer. If packet hits industry, we
will see laptop packet terminals.

The System V version of net may be a "hack job" but I can't afford
a "real machine" that has TCP/IP in the kernel.

There is a simple modification that eliminates most of the wasted CPU
time. The trick is to change the terminal driver configuration options

for the console tty as follows:

1. Comment out the fcntl() that sets NDELAY mode.

2. Set VMIN to 0 and VTIME to 1.

This causes the program to block for 1/10 second every time it cycles through the polling loop. The modified program uses far less CPU time than the original version. Here is the replacement for ioinit() in sys5_io.c:

```
/* Called at startup time to set up console I/O, memory heap */
ioinit()
{
     struct termio ttybuf;
     extern int iostop();

     (void) signal(SIGHUP, iostop);
     (void) signal(SIGINT, iostop);
     (void) signal(SIGQUIT, iostop);
     (void) signal(SIGTERM, iostop);

     ioctl(0, TCGETA, &ttybuf);
     savecon = ttybuf;

     ttybuf.c_iflag &= ~IXON;
     ttybuf.c_lflag &= ~(ICANON|ISIG|ECHO);
     ttybuf.c_cc[VTIME] = 1;
     ttybuf.c_cc[VMIN] = 0;
     if ((savettyfl = fcntl(0, F_GETFL, 0)) == -1) {
          perror("Could not read console flags");
          return -1;
     }
#ifdef   NOT_DEFINED
     fcntl(0, F_SETFL, savettyfl | O_NDELAY);
#endif

     ioctl(0, TCSETAW, &ttybuf);
}
```

>Is there a version of Net avaialble that will run under CP/M?

No. The original development was done on a Xerox 820 (that should date the project a bit!) under CP/M, but the code hasn't been run in that kind of environment for a couple of years, and a couple hundred K of space... :-)

Several folks, including PE1CHL, have taken stabs at porting a subset back to CP/M, all have decided there were other fish to fry, I believe.

It's probably possible to create a degenerate version that just allows Telnet and maybe FTP clients. If you want to go for it, the best bets would be to get a copy of the Aztec C compiler for CP/M (others may work, but Aztec is likely to be easy since we use Aztec under DOS as well), and start cutting things out. If you can make it work, send me diffs and I'll include it in a future release if possible.

Lately I've been receiving an increasing number of messages asking
questions about the UNIX ports of my code, particularly Xenix and AT&T
Unix System V (e.g., Microport).

I need to point out a few things:

1. I did not do these ports. In fact, all of my TCP/IP development work is done on an AT clone running MS-DOS 3.3. That is the ONLY version of NET about which I can answer questions.

2. As a matter of personal principle, I avoid all AT&T-based UNIX systems. All of the UNIX systems I use run Berkeley or Berkeley-derived code (e.g., SunOS, Ultrix). Since all BSD-based UNIX systems already have full TCP/IP support, there is little reason to run my code on those systems.

3. Bob Hoffman, hoffman@vax.cs.pittsburgh.edu, has graciously agreed to act as coordinator of those working with UNIX ports of my code. Please direct any questions about these versions to him, not to me.

Thanks!

>While a TNC operating at 1200 baud could be run as software in a general
>purpose computer, the faster you go the more expensive such a machine would
>have to be. A TNC is a specialized device, and could very well use a
>specialized if less powerful processor that would be cheaper. Why do
>that stuff that an HDLC chip would do in software?

I don't know if I understand what you are trying to say. I never said that HDLC framing should be done in software. What I was trying to say is that some thought needs to go into the proper division of responsibilities between general purpose host computer and the "slave" I/O hardware, keeping in mind the overhead of communicating across the connection between the two. It is clearly pointless to "offload" a function to an I/O device if it costs just as much (or more) for the host CPU to talk to that device, but such is the case right now with

external TNCs connected to hosts by serial lines.

My experience (in amateur packet radio and elsewhere) says that
low-level functions (framing, CRC calculation, raw packet buffering) are
properly done by dedicated hardware, while all higher level functions
(from the link layer protocol on up) are best done by software on the
host computer system.

Phil

This explains your recent tirade about running your code on Microport.

Unfortunately, those of us in the real world who don't have access to
BSD (and, to quote Eric Raymond, the "multi-tentacled *thing*" that is
its TTY driver) have to try to get the stuff to run on System V.

A plea:
Please confine your BSD bigotry to one source file, so that those of us
who have to make your code work in the real world won't have to rewrite
the entire package. Please?

I recently boughtan AEA PK-88 TNC for my packet station. I have had tremendous difficulties in making the TNC trigger the transmitter (YAESU FT-209RH). Can anyone enlighten me as to the proper connection between the TNC and my HT? I have tried several combinations, but to no avail. Is the TNC faulty? Receiver connection works perfectly.

HELP !!! COULD ANYBODY HELP ME WITH A MODIFICATION ON THE PK-80H TNC.

THE PK-80H IS PRETTY OLD AND IS ONLY CAPABLE OF HF OPERATION. IT CAN
ALSO GO ON VHF BUT WITH SOME MODIFICATION. HOWEVER, IT DOES NOT ALLOW
US TO GO BACK TO HF EASILY. THIS IS POSSIBLE ONLY THRU THE CHANGE OF
COMPONENTS AND ALIGNMENT AGAIN.

AS SUCH, I NEED THE HELP OF SOMEONE WHO HAS PERHAPS MADE AN EXTRA
BOARD OR SOMETHING ADDED TO THE TNC, SO THAT WE COULD SWITCH BETWEEN
HF AND VHF EASILY.

THANK YOU VERY MUCH !!! IAN HENG 9V1XA

I have a desktop computer running KA9Q's NET (v. 890421.1) on packet
radio, and have a laptop connected to that computer via SLIP. I have a
separate IP address for the laptop, and am successful in ftp'ing between
the two machines. Is it possible to use IP between the laptop and the
packet world, going through the desktop computer? I have a "route add
[<laptop IPaddress>] sl0" (sl0 being the slip interface) command in the

desktop's autoexec.net. I want to send mail from the laptop to IP'ers
on packet, sort of using the desktop as a gateway. Do I use
"route add....<gateway hostid>" for each address I want to reach? The
examples in USERMAN.DOC don't seem to help me figure this out.
In case I wanted to run two on-the-air packet stations for IP, I made
the laptop's IP address map to KB6CUN-5 (the desktop is KB6CUN-3) in the
local HOSTS files; I have a feeling this messes up the whole picture
for incoming mail, if I want it to hit the laptop on the SLIP line,
because packets are sent to KB6CUN-5 by other machines, and -3 won't
recognize them to route them via SLIP.
Can anyone give me some clues? Thanks.

I would be greatful if anyone could provide me with a public
domain packet control software package. The equipment
is a Tandy 1000 PC compatible w/hard disk, a MFJ TNC, and a Yaesu FT-209
2M rig. I need this to bootstrap several packet stations in development.

I would also consider reasonably priced software to do the same thing.

Wow, I'm impressed, Mark! You must be the last person in the world to not have Jay in his kill file!

(enter soap-box mode)

Jay, don't try to do foolish things like port code to SysV that is admittedly, unabashedly, purposfully Berkeleyoid, or at least stop ranting and raving about something that is free. You don't "have to make (Phil Karn's) code work in the real world". (Oh, sorry. I didn't notice that gun pointed at your head.) I don't see wonderful System-Visms from your keyboard being donated for the benefit of the community, so why don't you just shut up, you ignorant splut!

(end soap-box mode)

copied from packet:
    Subj: MFJ 1278 ROM

     The release that has been tested with NetRom and TheNet by K1LTJ
     and KA1RLX is as follows:

 AX.25 Level 2 Version 2.0 Release 2.3 12/22/88 Checksum $F6

The listing above is exactly as seen upon boot-up of the 1278. This version does have the mailbox but DOES NOT have the <B>ye and <H>elp commands within the mailbox. I am assuming that those commands were added in a later release of 2.3.

I have recieved many replies on this and there does seem to be a lot of confusion on the different rom versions and release dates of those versions. I hope this helps to clear some of that up.

I have been doing just what you describe for quite a while now, and it works great. I have my AT running KA9Q full-time with a tnc on 446.1. I also have a Macintosh running KA9Q occasionally, and I use a SLIP connection between the two. With this setup, I can access all nodes on the network from either the AT or the Mac.

There are two things that are necessary to make this work. First, you must configure your local nodes correctly. For the desktop (which I believe you said was the one connected to the tnc), all you need is to include a route command to send datagrams for the laptop to the SLIP port. For the laptop, all you need is a single route command that sends *everything* over the SLIP port; something like:

"route add default sl0 [desktop IP address]"

The other thing you need to do is get all of the nodes that talk to you
to configure your laptop in with a route command such as:

     "route add [laptop] <int> [desktop]"

This will cause all datagrams for [laptop] to be routed over interface
<int> to [desktop]. <int> is, of course, the same interface that the
node uses to talk to [desktop].

That's it! Note that the other nodes do not need to include an additional
ARP entry for the laptop, because they do not talk direct to it. However,
you might want to include an ARP entry on the desktop machine for the
laptop, so that nodes that have not added you to their route tables might
still be able to find you if they have a "default" port. Something like:

     "arp publish [laptop] <desktop callsign>"

This tells any ARP requestors to send datagrams for [laptop] to the
callsign of your desktop.

Good luck!

Is there any kind of NFS for the KA9Q SLIP?

I want to dedicate a machine to TCP/IP and it is not the machine I
normally use or want to use. I would like some way to easily connect
the two. Ideally ethernet but I can't justify the cost.

I have heard of a DOS device driver that will connect 2 PCs with
serial ports and mount the other's hard disks. This "poor man's NFS"
may be what I want.

Any ideas or comments?

Hi there netlanders !

I've got a little problem and hope for solution by news-readers...
I am running MINIX-ST 1.1 and like to include second terminal driver soft-
ware.

  Has anybody out there written a driver for serial i/o ?

  Is there any protocol (maybe tcp/ip) available for Minix-devices ?

  Did anybody already set up an AX.25 protocol for the packet radio
  communications ?

please respond to news - i'm not allowed to receive E-mail coming

over the normal nets (i hate those local policies...).

Another way for answering is postal mailing to the following address:

Fred Baumgarten
Kandelstrasse 27
D-7513 Stutensee-Buechig

Federal Republic of Germany

Thanks in advance, Fred

A question to the net:

I have been experiencing the following problem:
On an AT clone (with a cheapo serial card) and an
MFJ-1278, while running NET (Latest version) under
Desqview, the program sometimes hangs.

By hangs I mean that control is still had over the
program - I can still issue commands to it - but
it doesn't seem to have connection to the computer.
For example, when I know there is activity on the freq.
the con and dcd lights go on but NET doesn't recognize
or interpret any signals.

At other times, I lose control over the program. This
happens when multitasking with BM and Net. I think 640K
should be enough to run both?

It seems to me two separate problems are at work here,
does anyone have any suggestions?

Thanks in advance,
Joe,

You must have missed the pty driver for System V/AT, then.

My tone may have been more inflammatory than necessary, but there's a
kernel (no put intended) of real request in there: if the code is going
to be BSD-ized, at least make the job of adaptation easier for those of
us who are going to be attempting it.

No, there's no gun pointed at my head, but, unless I do something about
it, I have to assume that the NOS code - on which future enhancements to
the KA9Q suite will be based - will leave me behind. I still want to be
part of the packet revolution, and I see TCP/IP as the way to go, yet
Phil's comments seemed to say that he was going to exclude me and anyone
else running System V "as a matter of principle". He may have another
option. I don't, short of spending $10000 or going back from Unix to
MS-DOS.

>

Jay, perhaps you should consider the possibility that the "matter of principle" Phil talks about would involve the fact that he works for AT&T and maybe would want to avoid any problems regarding proprietary information?

Actually, I've disagreed with several things that have been done in net. Some of them have been debated on the mailing list, some via email and a bunch more I simply keep quiet on, realizing that I'm gaining the benefit of the free work of a lot of people. After I realize this fact, I save my criticism for those that deserve it. After all, you really do have a choice. You can either use what you get or you can change it to fit your needs or you can decide it does not fit your needs and simply ignore it.

Has anyone considered what it would take to port to Sys V rel 4.x?
I asked for it for that reason and was refused as well. I have to take
Jay's approach, are we, the Sys V users , ignored. Oh well so much for Unix
portability! I may as well run Plan-9 and be done with it.
 I guess Phil's concern is supporting this package, there would be a lot
of confusion. I find myself (a SysV kernel hack) interested in BSD internals
as well as some other operating systems. I try and WRITE portable code
not bitch at the "incompatibilities" of X vendor's release of *NIX
I may as well just buy a C64 and run the rest of the *utilities* from
my Kantronics.... Great stuff!

Mailbox what a novel concept.... maybe this will catch on someday...

So your complaint is that the new Karn TCP/IP package won't run on
your machine because it's specifically designed to run on some
other piece of hardware? You complain even though you know it's
not just an upgrade of his old code but instead a new product,
complete with its own operating system?

Hmm. Phil gives you the source for both of his TCP/IP packages.
Berkeley will give you the source for theirs.

There are essentially three choices here: 1) do it yourself, 2)
buy it from someone else, 3) go watch television where everything
is rosey and all problems are solved by pointing a gun at them.

I don't see that you have much valid cause for complaint.

MID-ATLANTIC SIX-METER BACKBONE ASSEMBLY BEGUN

During an informal meeting among the SYSOPs and node operators of Maryland, New Jersey, Northern Virginia, Pennsylvania and the District of Columbia in February 1989, a 6-meter frequency was selected for an experimental backbone (a packet-radio network that transfers mail automatically with access limited to PBBSs - Ed). Subsequently, a number of RCA 100-watt solid-state transceivers were obtained for $50 each and the hardware is now being assembled to extend a backbone from Virginia through Maryland to New Jersey. It is expected that few personal packet-radio stations will operate on 6 meters because of the potential of TVI to channel 2, however, TVI should not be a problem for the backbone because the nodes are located in remote areas far from residential television receivers.

The backbone group is interested in learning about other 6-meter backbone activity and experiences. The group believes that 6 meters is perfect for this application as they are trying to move all packet-radio activity except for local user access off 2 meters. Initially, the backbone will operate at 1200 bauds while propagation data is gathered. Hopefully, it will operate at a higher speed in the future. If you operate or plan to operate 6-meter packet radio, please drop the group a note so they can be better prepared for skip openings when the occur.

from Bob Bruninga, WB4APR @ W3IWI

MICROSAT BAND PLAN EXPLAINED

It has come to the attention of AMSAT-NA officials that there is a small, but vocal minority of radio amateurs who have questioned the MicroSat/ PACSAT and LUSAT frequency band plans. As announced in articles in AMSAT-NA Journal and 73 Magazine, the uplink frequencies for MicroSat will be 145.900, 145.920, 145.940 and 145.960 MHz; for LUSAT, 145.840, 145.860, 145.880 and 145.900 MHz. The downlink frequencies for MicroSat and LUSAT will be 437.050 and 437.150 MHz, respectively. AMSAT-NA officials wish to briefly explain the logic for choosing these frequencies for the "store-and-forward" satellites.

MicroSat/LUSAT uplink frequencies are located within the portion of the 2-meter spectrum designated for "Amateur Satellite Service," which includes 145.800 to 146.000 MHz and 435.000 to 438.000 MHz. Currently, these frequencies are used by amateur satellites AO-10, AO-13, FO-12, UO-9, UO-11 and, to a limited degree, RS10/11, however, in many parts of the world, 145.800 to 146.000 MHz is heavily populated and virtually unprotected. For example, many amateurs point to the "chaotic" conditions which exist on 2

meters in Japan. When the JARL and JAMSAT were designing FO-12, heavy interference problems were considered very carefully. When the designers of the MicroSats considered the QRM problem, they also came to the conclusion that Mode JD was the way to go. From an equipment standpoint, using Mode JD will permit many OSCAR-satellite users to use the same equipment they have available for Mode B operations. On the uplink, packets can be sent with a few watts from a 2-meter FM transceiver. Since most amateurs own 2-meter FM transceivers and an HF rig, obtaining a 70-cm converter is an easy way to build a basic MicroSat station. Thus, the designers of the MicroSats felt that Mode JD was a relatively inexpensive way to get started on MicroSat operations.

As far as the actual choice of the frequencies for the uplinks to MicroSat and LUSAT is concerned, you will notice that they are located on opposite ends of the spectrum. The decision by the designers to do this was based mostly on considerations of orbital dynamics. Because all of the MicroSats will be "dropped off" from the Ariane rocket at the same time, it will take many months before they "spread out" to the point that they all do not appear in the sky at the same time over a ground station. In order to avoid interference between users of MicroSat and LUSAT, the frequencies for the uplinks were widely spaced during the first several months.

As far as MicroSat users interfering with AO-10, AO-13 and other OSCAR satellites is concerned, the best possible passes for the MicroSats will be less than 17 minutes for an overhead pass. This means that there will be a potential of 45 minutes of QRM, but, as everyone who works packet radio knows, packets are by nature very short bursts. Anyone who has listened to FO-12 will also be aware that 90% of its transmissions are very short. Another important consideration is that the MicroSats will not digipeat; they will only accept messages for storage and allow users to read mail addressed to them (or read unconnected telemetry packets). Not permitting digipeating will help reduce any possibility of QRM caused by unattended beacons.

The final concern is that once radio amateurs hear packets being sent on the 2-meter satellite subband, terrestrial packeteers will start sending their packets within the 145.800 to 146.000 MHz spectrum. To the best knowledge of AMSAT-NA officials, this has not happened with the current OSCAR satellites and it is not expected to occur when the new MicroSats are launched. Because the equipment to send PSK packets to the MicroSats is quite different from the AFSK packets sent terrestrially, it would appear unlikely that such an "encroachment" would occur on the satellite sub-band. In general, amateurs hold very strongly to gentlemen's agreements concerning band plans.

It is hoped that this discussion about the MicroSat/LUSAT band plan can put to rest any lingering questions about the issue. In upcoming issues of QEX and ASR, Bob McGwier, N4HY, will discuss this topic in great detail. Until then, if you have further concerns or comments, please send them to:

KA9Q TCP/IP SOFTWARE REVISION 890421.1 REVEALED

(In the previous issue of Gateway, it was reported that a new release of the KA9Q TCP/IP software, revision 890421.1, for IBM PCs and compatible computers was available at the TAPR booth at the Dayton HamVention. The following story by N3EUA describes this new release in detail and explains how copies of the software may be obtained.)

This release constitutes an attempt to merge the best efforts of everyone that has been working on the KA9Q package since the last official release which was dated 871225.0. For those who have been tracking the beta releases, this package was built from 871225.33alpha.W9NK.4.1, with many additions. All users are encouraged to upgrade to this release as soon as possible.

Developers should be aware that this package likely represents the last official release of the KA9Q package until KA9Q finishes his internal rewrite to include a multitasking kernel, now known as the "NOS" version of NET. All development effort for new applications should be directed towards NOS.

Revision 890421.0 was distributed in a limited fashion on IBM PC floppies at the Dayton Hamvention. For PC users, there is no appreciable difference between .0 and .1 other than the addition of modem dialing for slip, though the documentation has been somewhat improved.

The following features are among those too numerous to mention that have been added since the 871225.0 release.

o Official support for the Atari ST, NEC PC-98XX, HP Portable Plus and various System V UNIX systems.

o Support for the FTP, Inc. packet driver specification on the IBM PC.

o Support for IP transport over NET/ROM networks and some NET/ROM user-level functionality.

o Prompting for RusernameS and RpasswordS in the FTP client.

o Finger application, similar to Berkeley Finger.

o AX.25 mailbox.

o Support for the W2XO PBBS when running under System V UNIX using System V

IPC between NET and W2XO PBBS.

o Complete rewrite of the documentation.

o Conversion to the Borland Turbo-C 2.0 Professional Package for compiling/assembling/linking on the IBM PC.

o Support for the MIT slfp serial line framing protocol.

o Modem dialing for slip and slfp.

There are a number of ways to obtain copies of the software.

Via FTP on Internet:

The software may be found on tomcat.gsfc.nasa.gov in the anonymous ftp directory called \public\tcp\net-8904. This is a good source for the code now. If you are not on the "real" Internet, tomcat has a 2400 bit/s slip port for dial-up users.

The software will also be available from wsmr-simtel20.army.mil shortly. This will probably be the most stable Internet source.

The machine col.hp.com contains a copy of the software in the directory ~ftp/ka9q. Access is quite reasonable from other sites on the HP Internet, but very slow for folks outside HP. This source is recommended only for HP employees.

Via UUCP or Telephone BBS:

Howard Leadmon, WB3FFV, has the software available on his BBS, which also supports UUCP. The WB3FFV BBS telephone numbers are 301-335-0858 for 1200/2400-baud non-MNP modems, 301-335-1955 for 2400-baud MNP and 9600/19200-baud PEP modems. The BBS uses data settings of 8 bits, no parity, 1 stop bit. It is accessible 24 hours per day except for routine maintenance.

Via Mail:

Tucson Amateur Packet Radio (TAPR) is distributing copies of this release on IBM-compatible 360-kbyte 5-1/4-inch diskettes.

SPACE SYMPOSIUM TO MARK 20TH ANNIVERSARY OF AMSAT-NA

This year is the twentieth anniversary of the Radio Amateur Satellite Corporation (AMSAT-NA) and in celebration of this event, plans are underway for the 1989 Space Symposium and Annual Meeting of AMSAT-NA to be hosted by the Central Iowa Technical Society (CITS) in Des Moines on November 10-12.

The schedule for the weekend is for registration and informal dining on Friday evening, registration, seminars, luncheon, banquet and annual meeting on Saturday, and on Sunday, seminars and open board meeting. Seminar topics include MicroSat/PACSAT, Phase IV, UoSAT D and E, satellite fox hunting, command station development program and digital signal processing. For more information, send an SASE to:

CITS - AMSAT 89
c/o Ralph Wallio, W0RPK
1250 Hwy G24
Indianola, IA 50125

STRAY BITS

This just in... the Rocky Mountain Packet Radio Association (RMPRA) will hold its 1989 Packetfest on Saturday, June 3 at 8:30 AM at the Honeywell Test Instruments Division facility, 4800 East Dry Creek Rd, Littleton, Colorado. Honeywell security requires that all Packetfest attendees be preregistered. Details from Bill Flynn, AI0C, 286 S Nome St, Aurora, CO 80012-1212.

W0RLI PBBS Version 10.06 has been released. Fixes include updating in BT, better handling of WP updates, better control of CTS to help avoid port hangs. Also, batch files can now be run by the server. Send bug reports to VE3GYQ @ VE3GYQ.

BB, the AA4RE mailbox program, Version 2.5 has been released and, at this time, is only available by downloading it (filename RBB25.ZIPS) from Data Library 9 (DL9) of CompuServe's HamNet.

APLink Version 3.71 has been released and is available from CompuServe's HamNet (Data Library 9, DL9). [APLink is a software system written by Victor Poor, W5SMM, that runs an AMTOR mailbox and a packet-radio BBS (PBBS) concurrently using a common set of message files on an IBM XT, AT or compatible computer under DOS 3.2 or higher.]

CONNECTICUT HAMS INVITED TO CONNECT

Packet radio hams in the state of Connecticut are invited to join the CONNECTicut Digital Radio Association (CONNECT for short), a new organization whose objectives are as follows.

- To provide effective and efficient digital networks via Amateur Radio into, out of and throughout Connecticut via the participation of association members (CONN NET).

- To coordinate these networks with all surrounding digital and nondigital communications groups.

- To inform digital users of the availability and features of these networks via the Packet Education Network (PEN).

- To educate users in the proper use of the networks (PEN).

Anyone wishing to join CONNECT should contact Tom Hogarty, KC1J, via his packet-radio mailbox on 145.01 or 145.07 MHz or via mail at 83 Harold Rd, Farmington, CT 06032.

GATEWAY CONTRIBUTIONS

Submissions for publication in Gateway are welcome. You may submit material via the US mail to:

Gateway
Stan Horzepa, WA1LOU
75 Kreger Drive
Wolcott, CT 06716-2702

or electronically, via CompuServe to user ID 70645,247. Via telephone, your editor can be reached on evenings and weekends at 203- 879-1348 and he can switch a modem on line to receive text at 300, 1200 or 2400 bit/s.

The deadline for each issue of Gateway is the Saturday preceding the issue date (which is typically a Friday).

REPRODUCTION OF GATEWAY MATERIAL

Material may be excerpted from Gateway without prior permission, provided that the original contributor is credited and Gateway is identified as the source.

>Jay, perhaps you should consider the possibility that the "matter of principle"
>Phil talks about would involve the fact that he works for AT&T and maybe
>would want to avoid any problems regarding proprietary information?

John,

I haven't worked for AT&T since midnight on January 1, 1984. Since then I have been employed by Bellcore, a subsidiary of the seven regional holding companies. I hope that by now most people understand that these entities are all completely independent of AT&T...

No, the "matter of personal principle" behind my avoidance of AT&T versions of UNIX simply has to do with their highly "closed" nature, which makes it very difficult for others to make significant modifications or additions to the kernel. Further, an extreme Not-Invented-Here syndrome (surpassed in the industry only by IBM) has caused AT&T to ignore most of the additions and enhancements contributed by Berkeley, with sockets and TCP/IP networking leading the list. Only recently has AT&T grudgingly admitted that some of its users might actually want TCP/IP networking, so you can now buy (at extra cost) TCP/IP packages for System V. To me this is much like making the clutch, transmission, wheels and tires of a new car "optional, extra cost items".

I would be willing to reconsider using AT&T UNIX once they include TCP/IP and all related networking facilities as standard, thoroughly supported features for no additional cost.

Phil

 js> Message-ID: <8906021243.AA04794@ucbvax.Berkeley.EDU>
 js> I have been experiencing the following problem:
 js> On an AT clone (with a cheapo serial card) and an

 js> MFJ-1278, while running NET (Latest version) under
 js> Desqview, the program sometimes hangs.

OK, I am assuming 8904.1 release of KA9Q's Net and that you are running
an AX25 connect and not SLIP to the TNC.
 js>
 js> By hangs I mean that control is still had over the
 js> program - I can still issue commands to it - but
 js> it doesn't seem to have connection to the computer.
 js> For example, when I know there is activity on the freq.
 js> the con and dcd lights go on but NET doesn't recognize
 js> or interpret any signals.

Well this is caused by a FAST I/O transfer between TNC and COMPUTER
with the swap time too long between the windows. You can correct
it in two ways that I know of... One) shorten the swap time to 1
forground and 1 background or Two) make all intrupts shared from
00 to 80 hex ie in the advance DV F1 window change the boxes for
intrupt to 80 and FF so only the upper intrupts are swapped out.
 js>
 js> At other times, I lose control over the program. This
 js> happens when multitasking with BM and Net. I think 640K
If you check the incomming mail you will find that most of the time
that the program hangs like that is from the incomming mail has finished
and it is time for NET to WRITE it into BM currently used mail file
and that the lock file is being hide from each program thus the lockup.
Make sure you are running BM v3.3.1 with the NET 890421.1 and not
some older version.

When I try "trace to <filename>" after issuing "trace ax0 111", on the console I get run-on unformatted lines with no headers and with periods for non-ASCII characters; the file <filename>, however, gets headers only! When I turn on Hex dump with "trace ax0 211", and continue tracing to a file, I get a similar situation with hex and ASCII to the console and just headers in the file. Is this the way it's supposed to work?

Neither my TNC terminal program, nor KA9Q work at all with
DESQVIEW. Both use their own drivers for the com ports, and
I suspect this doesn't get along with how DESQVIEW operates.

If you want a multitasking machine, run UNIX.

I have recently acquired the KA9Q TCP/IP package and have successfully
gotten it going with a KPC-2 TNC. I now have two problems:

1. I don't have an IP address, and I don't know who the coordinator is for my area (San Francisco, CA bay area).

2. I need the freq and callsign(s) of some TCP/IP nodes in my area to talk to (my hosts.net contains nothing useful at the moment). I've monitored the active packet freqs looking for an IP PID, but have never seen one. I guess I will have to digipeat/netrom somewhere to connect to the ampr internet.

If anyone can help me with either of the above, I would appreciate it.

Thanks,

Tony Fleig, KF6XH

A couple of months back I switched from using DoubleDOS to DESQview to run
the KA9Q NET software and have not had any problems... so it does work (in
at least some cases).

I am using DESQview version 2.24. The "Optimize Communications" switch
under the "P"erformance selection of the Advanced Setup menu is set to "Y".
(I've used both NET 881225.33 and 890421.1 in this configuration.)

I suppose this all should be on alt.unix.wars but I do have to at least say a
word about the issue of software portability.

Suppose you have a sheet full of dots in a fixed matrix that represent the features you might see in a computer system. You make up sheets of paper for each system, punching out holes when that system has that feature. Laying the sheet over the dots shows you the available features.

Now if you want to make sure your program is portable over systems X, Y, and Z, you overlay all three sheets and see what features are left. Use only those features, and your program is portable over those systems.

The problem with making a program TOO PORTABLE is that you have so many sheets of paper blocking so many features that by the time you evaluate the various systems, you have very few features available. I like the idea of portability, but it must be tempered to some degree. Without that, systems designers are taking a free ride at the expensive of those of us developing portable applications.

It also happens to be that UNIX System V version 3.* lacks so many of the features that academic developers are accustomed to. Of course BSD lacks the features of SysV as well. The common ground between these two systems is still yet way too small. So one normally chooses the system they are most familiar with until it becomes worthwhile to abandon it for a new and better one. I recently tried a SysV machine and WAS LOST. Things just did not even work. SysV was as different as BSD Unix and IBM's VM/CMS, to me that is, and I know both systems fairly well (especially VM/CMS).

For the time being *I* too choose BSD Unix, and await to see if SysV ver 4 will be good enough to switch over (but my expectations are low). I want source code, too, enough to rebuild the WHOLE THING.

Huh? KA9Q works just fine under DESQview. So do all of the comms programs I've tried. There are may well be exceptions amongst packet-specific terminal programs, but I know YAPP works under DV. And there are a great many people running BBS programs under DV, again with no problems. I'm running a couple of BBS ports (WA7MBL), plus the latest pre-NOS KA9Q bits handling two additional ports, all under DV. This is a mix of programs with separately-loaded and built-in com port drivers, and it all works. DESQview ain't UNIX, but it does a pretty impressive job of making MeSsy-DOS tolerable.

This question is actually a result of my taking over a modem based BBS, but I think it applies to packet radio as well.

For a bulletin board that is sponsored by something other than an individual (i.e. club, group, school), is it a) legal and/or b) ethical and/or c) the sysop's responsibility to read every mail message on the system?

There was a lawsuit recently filed in Indiana against the sysop of a modem BBS because he recovered a killed message on the system and allowed others to read it and it evidently contained some not-so-nice info. Anyway, this has led to some discussion here at Indiana U. I hope my question is clear enough...what does the
net think???

Over the last week or two I have been reading the many complaints about the KA9Q port for System V. First, I would like to offer an apology for not having caught some errors in the 890421 pre-release code. Several pieces of Unix support code that I sent to Bdale in February didn't make it into the 890421.0 release. I am in the process of tracking down all of the discrepancies and will forward the changes to Bdale this week.

When putting together a NET port, I test it on the following systems: a Sun-3 with SunOS 4.0.1, an AT&T 7300 with Unix 3.5, and an AT&T 3B2/310 with System V release 3.0. I understand the sizeof(int) vs sizeof(char *) problems that the Microport (or, more precisely, the 80x86) users are having. I do not run Unix on an Intel architecture, so I have to rely on those who do to send in their machine-specific code. My goal is that any System V user should be able to run NET unmodified, save for editing the Makefile and config.h.   I promise to include all Intel-specific code that is submitted to me.

Regarding NOS on Unix, there have been several people expressing interest in working on the port. Phil has done a nice job making the clients and servers adhere to a lightweight task model. I feel that it would be counter-productive to port NOS to Unix as a large monolithic process. Rather, I would like to see these lightweight processes become real Unix processes.

Since NOS uses the Berkeley socket mechanism, it seems to me that the best solution is to implement a socket library for System V based on the underlying interprocess communication (IPC) facilities. SysVr2 has three types of IPC: shared memory, message passing, and semaphores. SysVr3 includes these and adds a streams facility. At least one person

I know is in the process of writing a streams-based socket library.
This may be adaptable to the older IPC as well. NOS would then be
broken up into a daemon that handles the serial ports and TCP/IP/AX.25
protocols and the individual clients and servers would have new main()
routines written around them.

Regarding KA9Q on BSD systems, I'm afraid I've ignored those folks.
For a long time, nobody said anything about running KA9Q on BSD Unix,
so I just didn't do anything. Phil's solution to putting a Berkeley
system on the packet network is by far the easiest: run an ethernet
between the Berkeley system and a dedicated PC, and let the PC switch
packets between the ethernet and the packet radio network. For those
who wish to run KA9Q on a BSD system directly, I will try to bring the
BSD support up to date for the .2 release.

While I agree with Phil that developers should switch to NOS, I believe
that it would be bad PR to abandon 890421.x with serious bugs.

>us who are going to be attempting it.

There are actually quite a few of us "insiders" that consider adequate support
of sysV Unix a must. Don't worry, you won't be left out.

Despite my strong personal pro-BSD bigotry (not ashamed of it at all!), I
happen to run NET full time on an HP9000/550, under HP-UX 5.21... which is
effectively sysVr2, with no hope of improvement since it's an obsoleted machine
now. Oh to be running currently supported Iron with UX 6.5 that includes all

the BSD wonders... [sigh]

There is a very strong distinction, which may have gotten lost in the telling, between Phil's inclusion of BSD-style sockets as the interface mechanism between the network and application hunks of code, and the need to run the code on BSD flavors of Unix.

If you think about it, there's no good reason to want to run the code under BSD Unix. There is a compelling reason to run the code under "missed-em 5"...

You and about a billion other people. Anyway, release 3.x of the Clarkson packet driver collection is now available. The READ.ME file appears below.

Availability

The Clarkson collection of packet drivers is available by FTP, by archive-server, and by modem.

FTP:

sun.soe.clarkson.edu:/pub/ka9q/drivers.arc
grape.ecs.clarkson.edu:/e/tcpip/drivers.arc
flash.bellcore.com:/pub/ka9q/drivers.arc
louie.udel.edu:/pub/ka9q/drivers.arc

(On these last two, look in /pub first -- I had to ask the sysadmins to
move the drivers to /pub/ka9q, and they may not have gotten around to it.)

Archive-server:

Send mail to archive-server@sun.soe.clarkson.edu and put the following
command as the body of your message:
     send ka9q drivers01

Repeat for drivers02, drivers03, and drivers04. Combine the four parts
and unarchive it.

Modem:

Call the Clarkson Heath User's Group's BBS: (315)268-6667, 8N1,
1200/2400 Baud, 24 hours. Change to file area 24 and download drivers.arc.

Opus:

260/360 in the Nodelist. Drivers.arc is file requestable.

Release 3.0 of the Clarkson packet drivers

If you are a user, all you need do is locate the correct packet driver for your
interface, and read DRIVERS.DOC.

Enclosed you will find

3C501.ASM	Device dependent 3COM 3C501 code.
3C501.COM	Executable for a packet driver for the 3COM 3C501.
3C503.ASM	Device dependent 3COM 3C503 code.
3C503.COM	Executable for a packet driver for the 3COM 3C503.
3C523.ASM	Device dependent 3COM 3C523 code.
3C523.COM	Executable for a packet driver for the 3COM 3C523.
DEFS.ASM	Definitions and macros.
DRIVERS.DOC	User documentation.
GENERIC.ASM	Device dependent generic code (a skeleton only).
HEAD.ASM	Resident device independent generic code.
MAKEFILE	Makefile. Uses tasm and tlink, but MS may work.
NI5010.ASM	Device dependent Interlan NI5010 code.
NI5010.COM	Executable for a packet driver for the Interlan NI5010.
NI5210.ASM	Device dependent MICOM-Interlan NI5210 code.
NI5210.COM	Executable for a packet driver for the MICOM-Interlan NI5210.

PACKETQA.TXT Questions from R. Nelson and Answers from jbvb@vax.ftp.com
PACKET_D.108 Packet driver spec version 1.08
READ.ME   This file.
README.503   Bob Clements' README file for the 3c503.
SLIP8250.ASM Device dependent SLIP driver using IBM-PC 8250.
SLIP8250.COM Executable for a SLIP packet driver for the IBM-PC 8250.
TAIL.ASM   Non-resident device independent generic code.
WD8003E.ASM   Device dependent Western Digital WD-8003e code.
WD8003E.COM   Executable for a packet driver for the Western Digital WD-8003e.

I have been in a quandry for some time about the credit that I should take for these packet drivers. I created the infrastructure for the packet drivers, but all of the device dependent portions were written by other people. So I feel uncomfortable about taking all the credit. Probably the best term to describe what I do is "Editor and publisher", because I perform a function similar to that served in the literary world. So, I sign myself,

Russell Nelson, Editor of the Clarkson packet drivers.
nelson@clutx.clarkson.edu, nelson@clutx.bitnet

Changes from version 2.0 to 3.0 of the drivers:

NOTE: Only the SLIP8250, NI5210, and 3c523 drivers have been tested. All others are believed to work.

GNU General Public License adopted. The restriction on commercial usage prevented some companies from distributing the packet drivers. This is entirely my idea, so send any comments to nelson@clutx.clarkson.edu.
3c523 driver added, thanks to Dan Lanciani (ddl@harvard.edu).
Gregg Stefanik (wstef@eng.clemson.edu) is working on a 3c505 driver. Don't bug him about it unless you're willing to be a alpha tester.
User documentation added (DRIVERS.DOC).
Brad Clements (no relation to Bob Clements) fixed the NI5210 driver so that it will work with a MTU of 1500.
The NI5210 now checks for shorts and opens before it starts up, thanks to Brad.
All memory-mapped packet drivers now check the packet length in send_pkt to ensure that too-long packets get trapped. All packet drivers will work with MTUs of 1500 (plus 14 bytes of Ethernet header).
Deborah Swanberg noticed that attach_type was returning NO_CLASS when it meant to return NO_TYPE.
She also noted that packet drivers weren't returning unique handles. This is only a problem with Phil Karn's code, as his code directs *every* packet driver to the same receiver routine. With non-unique handles, it was impossible to tell which packet driver was upcalling the receiver. Unique handles are now generated, based on the starting segment of the driver. The latest version of Karn's code uses different receiver routines, so the code to implement this will eventually go away.
Tail.asm now prints the Ethernet address of the interface (if it is an Ethernet class device)
Micom has sold Interlan, and Racal has bought it, so perhaps the NI5210 is now the Racal-Interlan NI5210?

If anyone is interested in using the Zenith Z-100 with a SLIP packet driver, please
     send me (Russell Nelson) mail. I have it partially written, but will
     probably never use it myself.
WD8003E and 3c503 sped up slightly -- stole movemem from NI5210.

Changes from version 3 to 2.0 of the drivers:

Version numbering now changed. If the skeleton changes, the major version is
     incremented and all the minor versions are reset to zero.

Support for version 1.08 of the packet driver spec included.
Bob Clements' 3c503 driver added. See README.503.
Some comments improved.
BAD_COMMAND checking code fixed.
cld instructions added to ensure that DF=0.
NI5210 sped up slightly -- look at movemem in ni5210.asm for an especially
     fast routine to move memory around.

Changes from version 2 to 3 of the drivers:

SLIP8250 can now be one of three classes: SLIP, AX.25, and KISS.
Tail.asm now checks for a packet driver already at the given interrupt.
Tail.asm now echoes its arguments in hex and decimal.
Tail.asm will close stdout so that a file handle won't be used up in
     case the user redirects stdout to NUL.
Head.asm now supports driver termination.
Termin.com added to terminate a driver.
Head.asm now does a stack swap to avoid pushing too many things when
     interrupting MS-LOSS.

Changes from version 1 to 2 of the drivers:

!! Arguments are now in decimal by default !! Use a 0x prefix for hex.

DEFS.ASM created.
The loadport macro improved.
SLIP8250 driver added, thanks for a C version from Phil Karn.
     I've tried to put some 16550 support in, but I don't have one to
     test it with. The documentation insists the TBRE goes low when
     the transmit buffer is not empty, while it makes sense for it to stay
     high while the buffer is not full. I suspect the documentation is
     wrong.
NI5010 driver added, thanks for a C version from Bill Doster.
WD8003 driver added, by Bob Clements.
Loadport macro added to WD8003 driver by Russell Nelson.
Numeric arguments may now be specified in octal, decimal or hex, using the
     C notation.
Numeric arguments can now use up to 32 bits.
Source files reformatted.

The latest articles on the S2000 NORD><LINK debate ask for some
clarification. Our intention was to stay out of this discussion because
it is mostly done emotional and not rational and because we do not like
the libel and slander thrown around by S2000. So here is the (hopefully
last) statement:

Topic: 73 magazine, the NET/ROM-Nordlink question

This article is a good example of biased and unfair journalism. Because
73 magazine never answered to previous letters we have to answer public.

WB2KQI, the author, called me twice on the fone and although I asked
him for a written copy of his questions and promised to answer by
rapifax within 24 hours he insisted on a voice interview. During that
interview I got the impression that he already had made up his mind and
was just asking the same questions again and again because he didn't
like the answer. He also promised to send me a copy of the article - it
never arrived. Seems as if his memory is a bit damaged. He forgot the
main statements I made and gives some misquotations.

We do not want to discuss cloning here, that's common practice (but
done somewhat different from the way WB2KQI tells).

Some of the things he forgot to tell:

- the first crossband digipeater/node was made by NORD><LINK from TNC1s by connecting them thru the RS232 ports. We used a TNC source supplied to us by WA8DED and sent back the results (as source and documentation) to WA8DED. At that time there was some discussion with WA8DED and W6IXU on how to build a backbone. But only the crossband digi came out of that. If you look at the sources of that digi/node and of TheNet you will find similiar structures and variable names. This was long before NET/ROM appeared on the scene.

- TheNet was made using a different compiler version and a different optimizer then NET/ROM. The optimizer shrinks the code by some 30%. So the process "disassemble-deoptimize-decompile" could not work. How deoptimize if you don't know the way original optimization was done, how decompile if you don't have the original compiler? Have you ever heard about a decompiler that adds comments to the source?

- TheNet contains a lot more features and less bugs than NET/ROM.

- The report from WA6IGY is wrong in some parts (type of auto variables, optimization, etc).

- Level 1 and Level 2 of TheNet are made by minor changes to TheFirmware which is compatible to WA8DEDs firmware but is much faster and has less bugs and more features (another clone which WA8DED doesn't care about).

- We _bought_ NET/ROM and we _payed_ for it |
If our intention had been just to steel NET/ROM we would have published the call encrytion routines and the location of default parameters. That would have enabled all owners of NET/ROM to change their callsign (if needed to do so).

- After a short look at the sources any programer will tell you that it would have been extremely simple to hide any similiarities to NET/ROM - if we had wanted to do that. On the contrary: we put a lot of work into TheNet to make it as close to NET/ROM as possible.

Misquotations:

- The "high nosed attitude of WA8DED" was not his refusal to release the sources (we never asked him for that) but the way S2000 answered to bug reports and the way they handled updates. Bug reports were answered "it was intended to be that way" (even the wrong handling of FRMR) and the next version of NET/ROM came out with exactly theese bugs fixed the way we had proposed it. Updates were handled "there is no warranty, you have to buy it again" (with new bugs in it). We wonder why no one in the states took S2000 to the Better Bussiness Bureau.

- We never told anybody that TheNet is an independent development. We always stated that it is a clone of NET/ROM.

A closing remark: the author is asking for self policing. That's my credo too. So stay away from companies that spell HAM as Huge Amount of Money and try to ripoff your bucks by selling buggy EPROMs without any warranty, stay away from companies that call your boss to make false accusations regarding your hobby, stay away from companies that try to divide the amateur community by locking out some stations.

Topic: Statement by TAPR, stop of NNC development by NORD><LINK

The idea to put TheNet on the NNC came from TAPR last year. After some internal discussions we stopped our EWTNC development and agreed. Immediately after this the TAPR internal discussions started again. Obviously some directors of TAPR wanted the NNC to be filled with live, others preferred to let it die instead of using TheNet. DF2AU and DL1LBN went to Tucson and discussed the matter with some TAPR members and directors. Later on a written statement was sent to TAPR telling the history of TheNet. TAPR agreed. A formal written contract was made stating that the NNC was given to NORD><LINK on a permanent loan and giving NORD><LINK the right to make copies of the hardware for non commercial use. The NNC arrived (and we payed some 100$ on duties on it). The documentation that came with it was rather poor and some letters to TAPR asking for more were never answered.

Now TAPR changed it's minds and recalled the NNC. Didn't they read their own contract? We will not discuss with them. If it wasn't for the money and the time already spent on that project we would laugh about that (and file it as "things learned in the past").

So what will happen now? We will continue the 68070 based EWTNC and start another 80188 based TNC board for the IBM slot. And the NNC will be stone dead as it was before. Sorry for those that already bought a board.

73, Georg, DF2AU @ DK0MAV, on behalf of the NORD><LINK programers

According to the list I have, the coordinator for your area is Andy
Cromarty, N6JLJ.

Maybe I should post the whole list of address coordinators to this
newsgroup? This info seems to be more of a deep, dark secret than it
should be.

**** UoSAT-OSCAR-11 BULLETIN - 188 9th June 1989 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** Forth Diary Binary Packet Format - WOD **

A new binary dump format is now operating in the Diary cycle. The general format of the packet is shown below:-

Sync 1 - 50H
Sync 2 - 41H
Frame Count MSW
Frame Count LSW

Data
Data
Data
Data 64 bytes of data
Data
etc.

Checksum MSW
Checksum LSW 16 bit binary addition of all bytes excluding Syncs.

As described last week this format is used for an engineering frame, and can also be used for Whole Orbit Data dumps. In the WOD mode each 64 bytes of data is part of a memory dump, with the address of each packet being given by the

frame count. Each telemetry sample comprises 3 BCD digits which are packed as follows:-

```
|    Byte 1    |    Byte 2   |   Byte 3   |
 S1MSD          S1LSD   S2MSD        S2LSD
```

where MSN and LSN are the most and least significant digits of samples S1 and S2. This pattern repeats for the whole memory, and cycles through the channels in the dump. The number and type of channels in the dump can be found from the engineering frame.

As a trial this format will be transmitted on Tuesdays, initially with Channel 53. The data will be transmitted between the DCE titles and Telemetry and will replace the conventional WOD dump.

Mode-JL :     MA 110 to MA 145  !     MA 160 to MA 200
Mode-B  :     MA 145 to MA 255  !     MA 200 to MA 240
OFF     :              %        !     MA 240 to MA   3
Mode-S  :     MA 150 to MA 160  !     MA 210 to MA 222
```

Also, for a trial period the OMNI-directional 70cm antenna will be connected to the Mode-B RCVR from MA 20 to MA 40. These changes have been introduced to enable stations who have access around perigee to experiment with perigee operation. Mode S unchanged. 14May89: BLON/BLAT 212.0/+2.4 with a drift rate of 0.016/-0.061 deg/day, respectively.

Transponders will be in operation during the whole orbit from June 14 until Aug 16 due to excellent sunangle and power budget. No perigee operation between August and November due to perigee solar eclipses!

** UoSAT-D News **

Harold Price, NK6K has been performing some performance tests on the UoSAT-D PCE, the Microsat CPU, and other machines. The results are summarised below.

Using a dhryston C benchmark from Sept. '86 DDJ p.88, here are some performance numbers (using a 6MHz AT as the index). The same compiler and options were used (/AS /Ze /Zp /Ot /Gs). /Gs (no stack checking) was used because the S/C stack check is different than the dos version. Normally /G1 (80186 instruction set) would be used for S/C programs.

The RIC is the PC card we're using for the simulator and for SW development.

Device	CPU	Clock	dhrystons/sec	index
Toshiba 3200	80286	12 MHz	3762	2.03

AT Clone	80286	8 MHz	2145	1.16
IBM AT	80286	6 MHz	1850	1.00
UoSAT PCE	80C186	7.3728 MHz	1398 +	0.75
RIC	80186	7.3728 MHz	1391 +	0.75
AMSAT proto	V40	7.372 MHz	861	0.47
AMSAT flight	V40	4.608 MHz	538*	0.29*
IBM PC	8088	4.77 MHz	1531	0.29

+ The timer resolution of 10ms gives an uncertainty of +/-14 counts,
  these numbers are equivalent.

* calculated based on clock speed difference from wirewrap.

The RIC, Microsat Prototype, and UoSAT tests were done under the kernal, so
clock and scheduler overhead are included. Zero wait states were used.

Please use Bulletin ID UOSAT.261A if put on a packet radio BBS.

I've had a packet station set up for about a year now, and up to a month ago,
I've been able to connect and operate reasonably two PBBSs on .07
But lately, things got worse. I can still connect, but I have a hard time
getting reception of long packets. (short ones are easier, of course).
Strangely enough, when I'm not connected, but just monitoring the channel, I
seem to have an easier time recieving packets. (I thought: maybe my reciever
gets bad just after transmitting, but I tried various tests of this and it
seems ok). <doesn't make sense>
Only thing that I can think of is that for the past year untill a month ago,
this area had a shortage of rainfall, and this last month it rained a lot.

Could the extra water in the tree leaves (lots of trees around my QTH) be absorbing the RF (this is 2 meters) and spoiling reception? (lots of trees between my QTH and PBBS, about 5 miles of 'em). I noticed that the higher channels on VHF TV have also gotten weak. Or high humidity in the air? I didn't think this would affect 2meters. My antenna and coax are all inside the house, (in attic), so rain can't get at them. Maybe a wet roof is attenuating things? But, as far as I can tell, my transmitted signal is not impaired.
Now with these weaker signals, TNC RFI is a bigger problem. Maybe an analog fiber-optic link between the radio and TNC-computer would help. Anyone done something like this? expensive? Or just try to tighten up the TNC more?

Thanks in advance
please e-mail

I have had a number of local packet radio users running Macs
if there is a terminal program that allows split screen mode
to separate the send and receive data. I know of no such program
for the Mac, but have seen packet specific programs for IBM clones
that do this. Does anyone know of any Mac program, terminal or
packet, that does the same?

This message is to announce the availability of a NOS porting kit for both
the System V and the BSD UNIX operating systems.

I have seen people express the opinion that the best way to run
TCP/IP on packet radio from a BSD UNIX system is to have the KA9Q program
running on a dedicated PC. I find it hard to agree on that.
First, the new KA9Q NOS program does not use any more processor time than
most other programs. Secondly, the KA9Q program is more than just an IP
switch, you may want to run pure AX.25 or NET/ROM as well.
It is better to run the KA9Q program directly on the UNIX machine, at
least as long as it is completely isolated from the TCP/IP code in the
machines operating system.

If you want to be able to act as a gateway between the packet radio network and your local network, you could use a driver for the NIT interface that I have written.
It works on 4.3 BSD compatible machines that have support for the Network Interface Tap. There is one drawback however, the NIT driver has to monitor all packets on the ethernet, so the load on the machine will increase, to say the least. Using a PC for this particular purpose would be more efficient, but probably not as cheap as freeware...

It is much more difficult to make NET and particularly the new program, NOS, run efficiently on a System V machine. Phil Karn should not be blamed for this, if it is anybodys fault, it definitely is the fault of the System V designers.
Having a PC as a separate networking processor would probably be a good idea here. But then of course, you need some way to communicate between the System V machine and the PC...

I have NOS running here on a machine with System V release 3.2 and an 80386 CPU. And when I say running, I mean it. It is not supposed wait longer than 10 ms or so. NOS on a PC or a BSD UNIX machine sits idle when it has nothing to do, while this one keeps spinning.
NOS is, or at least it can be, interrupt driven. If all ttys are STREAMS drivers you can arrange to get an interrupt whenever new data has arrived on the read queue. This works fine on a BSD machine but not on System V. Instead one has to resort to a commuter loop that repeatedly tried to read the ttys, just like how it is done in NET. But there is no need to despair, I have been told that this problem will be solved in System V release 4.

NOS needs some kind of timer interrupt at regular intervals, several times per second. This is easily done on BSD machines with the ualarm() call. System V designers however, apparently never imagined that people would like to use timers with a granularity of less than a second.
I am solving the problem by having a separate process that handles the timing by making dummy calls to poll(). It is possible to specify that the poll() call should timeout after a certain number of milliseconds. Earlier versions of System V may not even have the poll() function, but there should be other ways of solving this problem on those machines.

There are not only performance problems to overcome on System V however. The worst problem is that you are not allowed to move the stack pointer below the heap. At least not on the 80386 machine I am using. The multitasker in NOS relies on that every NOS process (or thread) has its own stack in the data segment of the UNIX process. On some machines, for instance MS/DOS machines and the SUN-3 with SunOS 4.0, this works just fine. Apparently SunOS 4.0 (mostly 4.3 BSD) never checks whether the stack pointer is within legal limits or not. On a SUN-4 (a Sparc RISC-processor machine) also running SunOS 4.0, the same program would crash. The 80386 System V machine, on the other hand, would simply refuse to make the stack pointer point to the data segment.
Unfortunately this kind of behaviour makes NOS somewhat difficult to port.

The way I have worked around the problem is to use parts of the machines

stack segment as stacks for the NOS processes. Obviously this is risky
business. The operating system does not know that those parts of the
stack segment are in use and may page out that part of the memory when
it needs to. When the stack pointer is eventually moved to that area
I guess the machine might not want to page it back since is not supposed
to tamper with anything that is above the stack pointer in memory.
I have not experienced any problems so far, though, but I do not guarantee
that it will work reliably in the long run!
I would be interested to hear from anybody who knows of a better way of
solving this problem.

The source for the NOS porting kit is available with anonymous ftp on the
Internet from sics.se (192.16.123.90).
The filename is: archive/packet/ka9q/nos/nosunix.tar
The archive contains the files for both BSD and System V, including the
NIT driver that I mentioned previously (for 4.3 BSD or equivalent only).

There is no warranty whatsoever. Good luck!

     Anders SM0RGV

Hello All,

Would anyone on the net know of machines from which I can FTP details on
TheNet and the KA9Q TCP/IP S/W for the PC. I'm specifically looking for
operating manual type documentation both for the hardware required and for
the software itself.

Many 73,

Mike.

Again I am asking for any information you can give me. Sofar I have
not gotten ONE response.

Someone out there has to be doing this!!

I have a SCO Xenix box at home and work. I want to tie them together
via radio. I would like to get at least 2400 Baud out of it.
It does not have to be packet (direct two-way connect is ok, but it
HAS to be bi-directional at ALL times).

Has anyone done this? Can someone help me? ANy ideas on who I should
contact? What would it cost? Etc.

Thanks,

I have both, an old 1270 which I upgraded to 32K and KISS firmware, and
a 1278. What I've found out is the need to fully align the units before

really being serious about performance. In each case I got out the scope
and freq counter and performed all of the alignment steps in the manuals.
I think, for the price difference the MFJs have filled my expectations.
So, expect to save a few bucks but also expect to do some tweaking.

>[discussion of size, cost and power considerations for TNCs vs PCs]

I don't know of too many TNCs that are useful by themselves to end users; in most cases people plug them into dumb terminals or PCs programmed to operate as dumb terminals. With PCs (generically speaking) now having pretty much displaced dumb terminals, though, it seems to make much more sense to move the functions now done by TNCs into the PCs, instead of wasting the PC's capability. Several amateur manufacturers, including HAPN, DRSI and PACCOMM, have followed this trend by marketing packet adaptor boards for the IBM PC. They contain HDLC interface chips plus the modem, so all you need in addition to the PC and interface is a radio. Because you don't need a box or power supply, it's a pretty economical approach too (especially if you want more than one channel).

Using PCs for packet in this way has a lot of advantages, not the least of which is the enormously easier task of developing experimental software. Having in years past played the game of perpetual EPROM burning, I find it a heck of a lot more pleasant to edit, compile and test my packet protocol software on a PC with a hard disk, faster CPU and far more memory than a TNC.

The TNC has served its purpose well, but it was conceived with the technology of the middle 1970s in mind. It's time to move on.

Phil

>   What exactly is the "NNC" (Network Node Controller??)? I've run
>into references to the NNC here and there but have yet to find a description
>of the device. Anyone have the gory details?

The NNC was a TAPR project several years to design a dedicated packet switch
board intended primarily for backbone use. It was supposed to complement
the TNC, which (despite NET/ROM) was intended for end-user use.

The problem with the NNC was that the CPU technology chosen (Hitachi
64180, essentially a Z-80 clone) was obsolete even before the first
prototype was built, and the price/performance ratio couldn't compete
with the cheap Taiwanese PC clones. A few prototypes were built, but
they didn't stimulate much interest among the software writers.

A newer and much better "nnc" is the PS-186 project by SANDPAC, the San
Diego packet group. The PS-186 uses the Intel 80186 CPU, and it has the
necessary hardware to support multiple high speed (1 megabit) links. The
PS-186 design has been licensed to AEA for manufacture, but it has been
slow to start again because of a present lack of software, and because
of a perceived lack of immediate need for a high performance networking
engine (running a PS-186 with 1200 baud links is killing flies with a
battleship). This situation is changing, however, as WA4DSY modems
become more widespread and N6GN makes progress with his microwave
megabit modems. Bdale (N3EUA) is working on porting my TCP/IP code to
the board.

From: karn@faline.bellcore.com (Phil R. Karn)

ARPA Suite - the set of protocols standardized by the Advanced Research Projects Agency of the US Department of Defense. Includes TCP and IP as elements, but leaves the lower levels (subnetwork and down) deliberately unspecified; the ARPA suite can be run on top of multiple subnetworks, unifying them into a single Internet.

ASLIP - Asynchronous Serial Line (usually just called SLIP). A technique for encoding IP datagrams so they can be sent across ordinary asynchronous modems and communications hardware.

AX.25 - an amateur packet radio link level protocol that borrows the link layer from X.25 (also known as "LAPB"), modifies it, and tacks a datagram-style address/routing header on front.

CLNS - Connectionless Network Service (see connectionless, datagram).

CMU/MIT PC/IP - one of the public domain packages that implement the ARPA protocols on the IBM PC and its clones.

connectionless - refers to a packet protocol or service that does not have the concept of a "connection". Packets may be sent at will, without prior arrangement or need for connection setup/teardown procedures.

connection-oriented - refers to a protocol or service that requires that a logical or virtual "connection" first be established with a special procedure before data can be sent. Another procedure is used to "tear down" the connection when it is no longer needed.

CONS - Connection Oriented Network Service (see connection-oriented, virtual circuit).

COSI - Connection-oriented Open Systems Interconnect. A project of W2VY and N2DSY to implement for amateur packet radio use the connection-oriented protocols published by the International Standards Organization (ISO) and the International Consultative Committee for

Telephony and Telegraphy (CCITT). (OSI protocols include both connection-oriented and connectionless flavors, hence the inclusion of the qualifier "connection-oriented" in the name). The COSI software is presently under development. [Note: This package has been renamed ROSE.]

datagram - Information packets in a connectionless environment. Datagrams are completely self-contained as far as the network is concerned. The information needed to get each datagram to its destination (including, but not limited to, full source and destination addresses) is carried in each datagram.

DDN Protocol Suite (Defense Data Network Protocol Suite). See ARPA Protocol Suite.

duplex digi - like a simplex digi, except that different receive and transmit frequencies are used. Allows simultaneous reception and transmission.

Gateway - a very general term for anything that connects two networks together. In the ARPA world, "gateway" has a much more specific meaning: a packet switch that handles IP datagrams.

IP - Internet Protocol. The core protocol of the ARPA suite. IP is a simple connectionless (datagram) protocol that handles addressing, fragmentation and type-of service routing in the heterogeneous internetwork environment.

IS - Intermediate System. ISO's term for a packet switch.

ISO - International Standards Organization. Publishes specifications for everything from screw threads to computer communication protocols. Also, International Snake Oi...oops, promised to keep things neutral. :-)

KA9Q Internet - name for a C software package developed by KA9Q with programming contributions from N3EUA, K3MC, NG6Q, WA3CVG, PA0GRI, NN2Z, WB6ECE, AJ9X, K4FUM, N9DVG, K3EZ and probably some others I've overlooked. Implements the major elements of the ARPA protocol suite: IP, ICMP, TCP, UDP, Telnet, FTP, SMTP and ARP. Also implements subnetwork drivers for SLIP, KISS, AX.25, Ethernet and Appletalk. Primary environment is the IBM PC (and clones), but has been ported to 68K-based machines like the Commodore Amiga and Apple Macintosh, also to UNIX System 5 environments. Sources, objects and documentation are available for anonymous ftp from flash.bellcore.com under /pub/ka9q.

KISS - Keep it Simple Stupid. An extremely simple (some might say "hack job") interface protocol between a computer and a TNC that gives the computer complete control over and access to the frames sent and received by the TNC. Used by my Internet (TCP/IP) package as a way of bypassing the unwanted AX.25 protocol and human user interface firmware in the TNCs.

NET/ROM - A proprietary product of Software 2000, Inc (WA8DED and W6IXU). Consists of ROM firmware for the TNC-2. Implements AX.25 at the link layer, with ad-hoc protocols at the network and transport layer. Also provides a command interpreter and "transport level bridge" that patches incoming

or outgoing vanilla AX.25 connections to internal transport layer connections. Uses datagrams at the network layer, virtual circuits at the transport layer. Provides automatic routing between NET/ROM nodes, the user is still responsible for "source routing" between the end NET/ROM nodes and the ultimate source and destination.

OSI - Open Systems Interconnect. A project of the ISO to develop a set of computer communications protocols.

PAD - Packet Assembler/Disassembler. A device that interfaces an ordinary "dumb" terminal to an X.25 packet network. It gathers typed characters into outgoing packets and translates incoming packets back into serial asynchronous data streams. Also provides a simple command interpreter for setting up and tearing down connections, controlling parameters, etc. The amateur packet radio TNC was heavily modeled on the PAD.

PTT - Postal, Telephone and Telegraph authority. The government-owned phone monopoly found in almost every country except the USA.

RFC - Request for Comments. Memoranda published in electronic form by the ARPA Network Information Center. Documents everything from informal proposals to established standards.

Router - Yet another term for a packet switch. Used by Xerox's XNS and Digital's DECNET, two proprietary networking protocol suites very similar to (but incompatible with) the ARPA suite (and with each other).

simplex digi - a regenerative digital repeater that receives a packet, verifies that it was received correctly, and (if appropriate) retransmits it on the same frequency it was received on.

TCP - Transmission Control Protocol. A major element of the ARPA Suite. Provides reliable, connection-oriented byte stream service on an end-to-end basis. Runs atop IP and sits at the transport and session layers.

TCP/IP - the most important two protocols from the DARPA Internet protocol suite. Often used somewhat inaccurately to refer to the entire Internet suite. The rest of the ARPA suite includes protocols for file transfer, remote login and mail transfer. The distinguishing feature of the Internet suite of protocols is that they are specifically designed to run on top of an ad-hoc collection of dissimilar subnetworks, forming a virtual "super net" known as an Internet. Amateur packet radio is only one of the many subnetworks now supporting the Internet protocols.

TELNET - A presentation/application protocol in the ARPA Suite used for terminal to terminal and terminal to host communications (e.g., remote login).

TP4 - An element of the ISO OSI suite. A transport protocol that provides reliable, connection-oriented byte stream service on an end-to-end basis, analogous to TCP in the ARPA suite.

VC - virtual circuit. The service provided by a connection-oriented network

(qv). Virtual circuit data packets generally carry less header information than datagrams, since addresses have been specified at connection setup time.

wideband packet - Anything faster than 1200 baud. Generally refers to operation at 56kbps with modems designed by WA4DSY.

W0RLI - Hank Orelson, W0RLI, author of a very widely used packet bulletin board.

X.25 - A CCITT standard protocol for the subscriber interface to a public packet switched network. Consists of two layers, link (level 2) and packet (level 3). The amateur AX.25 protocol is a highly modified version of just the link layer of X.25; it does not have a packet layer.

X.25 - an international standard access protocol for public data networks. NOT currently used on amateur radio, despite our use of the misnomer "AX.25".

Stan Horzepa, WA1LOU, Editor - - Volume 5, Number 16 - - April 28, 1989

HF PACKET-RADIO COOPERATIVE DESIGN EFFORT

On April 5, the ARRL announced the creation of a new project to develop the

next generation of modems and protocols for HF packet-radio operation. The project will coordinate the efforts of Amateur Radio designers whose proposals are adopted by the ARRL. Modest funding will be available for reimbursement of approved direct out-of- pocket expenses related to the development of prototypes, but not labor, overhead or other costs. General information concerning this project can be found in the May issue of QST, pages 55-56.

Funding for this project is to come from two sources. One is from the League's Technology Fund, which welcomes individual and corporate contributions. Also, the League has applied to the Federal Emergency Management Agency (FEMA) for a small grant to help underwrite this project. FEMA has indicated keen interest in this project because they want to retain their ability to communicate directly with ham radio operators using packet radio and, furthermore, they need to encourage interoperability between equipment owned by FEMA and amateurs. In addition, they believe that hams will develop equipment that is inexpensive enough to permit large-quantity procurement by the Federal Government.

Serious designers interested in participating in this development project may obtain further information from Lori Weinberg at ARRL Headquarters.

CODELESS LICENSE WITH PACKET-RADIO PRIVILEGES PROPOSED

A special committee appointed by ARRL President Larry E. Price, W4RA, has submitted a report recommending the creation of a class of Amateur Radio license not requiring a knowledge of Morse code. The report was presented to the ARRL Executive Committee, which met on April 1; the Executive Committee did not take a position on the substance of the report, but referred it to the full Board of Directors for consideration during its July 21-22, 1989, meeting. ARRL members, other licensed radio amateurs and others interested in Amateur Radio are invited to review the report and to make their views known to ARRL Division Directors, whose names appear on page 8 of QST.

The special committee stressed that its proposal, if adopted, would not cause any licensee to lose any present privileges. It proposed a new class of Amateur Radio license, with a written examination somewhat more comprehensive that the present Technician exam, but with no requirement for a Morse code examination. Holders would be permitted to operate on all frequencies and with all privileges available to Technicians above 30 MHz, except that 2-meter operation would be limited to frequencies between 144.9 and 145.1 MHz and to digital modes only. Examinations would be given only by accredited Volunteer Examiners and distinctive call signs would be assigned.

The mission of the committee was "to explore the implication of a no-code amateur license." To carry out this mission, President Price appointed a distinguished committee consisting of members from the ARRL Board of Directors, Amateur Radio industry and radio amateurs at large, as follows:

ARRL Vice President George S. Wilson III, W4OYI, Chairman
John Crovelli, W2GD, At Large

Y.E. (Ed) Juge, W5TOO, Industry Representative
Kenneth G. Kopp, K0PP, At Large
C. Mike Lamb, N7ML, Industry Representative
Rod Stafford, KB6ZV, ARRL Director, Pacific Division

In addition, the following consultants were designated:

Thomas B. J. Atkins, VE3CDM, CRRL President
Larry E. Price, W4RA, ARRL President
Leland Smith, W5KL, QCWA President
David Sumner, K1ZZ, ARRL Executive Vice President

The committee carefully reviewed a wealth of input from interested individuals and Amateur Radio clubs, as well as information it had requested from International Amateur Radio Union (IARU) member societies in other countries which have a code-free class of amateur license. A large number of alternatives were considered by the committee in developing its recommendations.

ARRL Executive Vice President Sumner stressed that the committee's report does not represent League policy at this time. The Board of Directors is the policy-making body of the organization and, as such, will determine whether the report, with or without modifications, will become League policy. He pointed out that the League is a representative democracy, with Directors elected to represent the members of their Divisions. Accordingly, anyone reading the report and wishing to have his or her views considered is urged to write the Director of their Division sometime prior to the July Board Meeting.

TEXNET VERSION 1.4 SOURCE CODE RELEASED

The Texas Packet Radio Society has released Version 1.4 of the TexNet system source code. This version will assemble without editing under Microsoft's M80 Version 3.44. The features incorporated into the source code of this version include all of those announced for the EPROM image of version 1.2. They are calling CQ, multiple Packet Message Servers, multiple Weather Information Servers, automatic user routing to network default service nodes and an improved node statistics display. The code may be downloaded from CompuServe's HamNet (data library "DL9").

from Bill Wade, WD5HJP via CompuServe's HamNet

NEW ROSE SWITCH AND SERVER RELEASED

The Radio Amateur Telecommunications Society (RATS) has released version 330 (for March 30) of Tom Moulton's (W2VY) ROSE X.25 Packet Switch and Brian Riley's (KA2BQE) ROSErver/PRMBS software.

The switch software runs in a TNC 2 (or clone) or a PacComm DR-200. It supports back-to-back TNC configuration. The new version of the software has several minor bug fixes and has been in operation on eight switches in New Jersey for several weeks without problem. The server software runs on any MS-DOS/PC-DOS compatible computer and provides many handy user and

SYSOP functions that are unique to PBBSs.

The software may be downloaded from CompuServe's HamNet (data library "DL9") or from The RATS BBS at 201-387-8898. Log on as "rats" ("rats" must be entered in lowercase) and a menu will appear listing current files followed by a prompt for your name, etc and then the file name. The file transfer is available using XMODEM only.

from J. Gordon Beattie, Jr, N2DSY via CompuServe's HamNet

ATARI ST MAILBOX AVAILABLE

Thor Andersen, LA2DAA, has written a "W0RLI mailbox" program for the Atari ST 520 and 1040 computers. The software has been tested with an AEA PK-232 and PacComm TNC-200 and works fine with both TNCs. To obtain a copy of the software, send a 350-kbyte or 720-kbyte diskette containing public domain programs to:

CLUB CLIPPINGS

Illinois

The Central Illinois Packet Radio Users Society (CIPRUS) is working hard to provide an intrastate East-West North-South link. This summer full-duplex radios with 56-kbit/s modems will be installed in the 450-MHz band. Achieving these goals takes a lot of time and money and anyone willing to help the cause are invited to join. For further information contact:

Larry Keeran, K9ORP, RR1, Box 99B, Downs, IL 61736-9717

Japan

Oimo Club was founded in 1988 by Shigeki Matsushima, JK1RJQ, and Dai Yokota, JK1LOT, for the enjoyment of writing software for packet radio. The club released "oimo," which is a mailer for the user of the KA9Q TCP/IP software package. They are now developing a news- distribution system for the KA9Q TCP/IP environment. For more information concerning the club and/or its products, contact:

G8BPQ TheNode PROGRESS REPORT

It is now a year since I started writing my PC-based AX.25 switching software. I'll summarize its main features.

The system was originally planned to be a high performance network node. At the time, the only way of building multiband nodes was to interlink TNC 2 (or compatible) TNCs running NET/ROM software via a multidropped asynchronous bus running at 9600 bit/s. This was expensive in both hardware and software and was limited in both AX.25 channel speed and interport bandwidth. Furthermore, the method of interlinking the TNCs (via a diode matrix) made nodes with more than four ports very difficult to implement.

Things have changed somewhat over the past year (the software costs have been reduced, a variety of TNC 2 clones have been produced and improved interlinking techniques developed), but there is still nothing capable of running very fast links. Also, with the rapid expansion of the network, the need for each port of a multiport node to have its own call sign and, hence, entry into the nodes list, has caused the list to get rather large. My software allows a multiport node to run with a single call sign, supports AX.25 links up to at least 64-kbit/s (given suitable communications hardware) and eliminates the bottleneck of the asynchronous link between ports.

The software also allows the user or, more usefully, a PBBS, direct access to the network. This was originally thought to be of less importance than the improved node performance, but the introduction of the multiport PBBSs and the rather slow introduction of radios and modems capable of high-speed operation [not to mention the licensing problems on 23 cm, the band generally regarded as ideal for high-speed operation), has meant that initial installations have been made primarily to support multi-user PBBSs. The software will support up to 16 copies of the chief multi-user PBBSs that run in a multitasking environment (WA7MBL and W0RLI) or up to 16 users on the G8UFQ system (although the PBBSs themselves may not support so many copies). This traffic may be trunked over a single radio link (preferably at 9600 bit/s on a dedicated link) to the nearest network node. All PBBS

ports have the same call sign, which also appears in the nodes list of neighboring network nodes, allowing the user to connect directly from the local node.

Current Status

The software has been running at some sites since September and a "beta test" stage commenced in mid-December. Approximately six copies are currently running and are supporting WA7MBL, W0RLI and G8UFQ PBBSs. The software seems to behave reasonably well, but a few unexplained crashes have occurred, so there is still some way to go before it is fit for general release. Also no one is currently running it as a major switching node.

Benefits to SYSOPs

The system offers two main benefits to PBBS operators and two to PBBS users. It allows a multiuser WA7MBL or W0RLI system to operate with just one radio instead of a separate TNC and transceiver (and band) for each port. Setting up the forwarding system is greatly simplified, as the networking software does away with the need to define each step in the FWD file. The forwarding system should also be more reliable and the network will automatically reroute around a failed link.

The user benefits from being able to call the PBBS directly from his local node, by the SYSOP being able to support more simultaneous users and by not having to try several different routes and call signs to find a free port.

Future Plans

Once the current beta test phase is completed, I have a bit of work to do to make the system more like the existing networking code (eg, sorting nodes list into alphabetical order and implementing the CQ command). I have found a source for a communications card which will run up to at least 256-kbit/s, so I will produce a driver for that to be ready when very fast microwave links become available. I am also planning a version which can run from PROM, so that a node can be built using a PC motherboard (now available very cheaply) without disk drives.

Further in the future is investigation into protocols suitable for building a high speed "trunk overlay" network. The existing NET/ROM system works pretty well at current link speeds and relatively limited total range, but I do not think it is really up to coping with a nationwide network. We may end up with regional NET/ROM-like systems, interlinked by some other system. Any ideas would be welcome!

(As we were going to press, news was received of the untimely death of Mr G.J. Chester, G8UFQ, whose PBBS software is mentioned in this article. - Ed)

by John Wiseman, G8BPQ; from Connect International,

STRAY BITS

Your editor will attend the Dayton HamVention and file a report concerning the HamVention's packet-radio activities in the next issue of the newsletter. There is sure to be a plethora of new hardware and software, both commercial and noncommercial, to report to you (I hope I will be able to keep some of my money in my pocket rather than packet).

Tom Moulton, W2VY @ KD6TH, is trying to compile a list of all ROSE X.25 Switch SYSOPs that will be used by others to help expand the connectivity of the ROSE network. If you are running a ROSE-colored switch, send Tom your call sign @ home PBBS, telephone number and any known gateways to facilities such as KA-Nodes, PBBSs, NET/ROMs, HF gateways, etc.

A number of readers have asked about the source for the Japanese 9600-bit/s modem mentioned in Gateway, Volume 5, Number 10. The modem comes from PRUG. Their address is printed under "Club Clippings" elsewhere in this issue.

Budd Turner, N7EOJ, has released the latest version of his packet- radio network map of the western United States. The map covers the 6th and 7th call districts plus 0-district state Colorado and 5th- district state New Mexico and includes digipeaters, PBBSs, gateways, and network nodes. The map and an accompanying node alias-call sign cross-reference table are available by sending an SASE to Budd at 412 N Belvedere Av, Tucson, AZ 85711.

GATEWAY CONTRIBUTIONS

Submissions for publication in Gateway are welcome. You may submit material via the US mail to:

> Gateway
> Stan Horzepa, WA1LOU
> 75 Kreger Drive
> Wolcott, CT 06716-2702

or electronically, via CompuServe to user ID 70645,247. Via telephone, your editor can be reached on evenings and weekends at 203-879-1348 and he can switch a modem on line to receive text at 300, 1200 or 2400 bit/s.

The deadline for each issue of Gateway is the Saturday preceding the issue date (which is typically a Friday).

REPRODUCTION OF GATEWAY MATERIAL

Material may be excerpted from Gateway without prior permission, provided that the original contributor is credited and Gateway is identified as the source.

>>You're in the tiny minority. I do have to consider the larger ham
>>community, and they've told us that they do perceive it that way.
>The minority of what? If you only canvass the existing repeater owners
>(which dominiate every frequency coordinating body I've ever seen -- which
>is why they're usually called "repeater councils") of COURSE you will find
>that most want to preserve the status quo.

The minority of the larger ham community - at least those that have
chosen to express an opinion to us. As I've said countless times before,
we don't care if a member is a repeater trustee. You have obviously
never been to one of our meetings. (Yes, I understand that there's a bit
of a distance problem...:-)

>>Wanna use that space for repeaters? [145.5-145.8] Go talk to the FCC, not me.
>What gave you this idea? We already have plenty of space, perhaps too much
>space, on 2m that is occupied by repeaters. There needs to be room for other
>modes, e.g., FM simplex, SSB and weak signal work, packet, satellite and so
>on. The reason we still have repeater subbands on 2m even in this era of
>deregulation is recognition by the FCC that without subbands, FM repeaters
>would immediately swallow up the entire band.

Waitaminute. First you argue that packet duplex repeaters need space,
and that the FM repeaters are soaking it all up. Now you say that we
don't need repeaters, or more repeater frequencies. Huh?
What, exactly DO you want?
Do you want most of the FM repeaters to go away? Or do you want more
space for packet applications? If 145.5-145.8 isn't going to step on the
satellite users, why not use it?

>This is news to me. A check of my references shows that EVERY unmanned

>amateur satellite -- with one exception -- from Oscar-6 to the present that
>uses 2m does (or did) so in the 145.8-146.0 segment. (The one exception is
>Oscar-13, whose mode J uplink listens between 144.425 and 144.475 MHz.) Even
>the Russian RS satellites follow this convention. The *only* space
>operation I know of on 145.55 MHz has been the US and Soviet 'ham-in-space'
>flights. Being more like DX-peditions than anything else, these are
>obviously in a special category.

This objection was raised, to the best of my recollection, in QST
several years ago. All of my QSTs older than a year got trashed :-(, so
I can't quote an exact issue. The general perception, though, is that
anyone operating between 145.5 and 146 is going to step on satellite
users, and that's a big no-no. If that's not true, then maybe you, as a
prominent member of the satellite community, should do something about
it.

>>I've said before that 220 is a special case: the FCC's grab makes it
>>obvious to repeater trustees that they will have to move. The band's
>>also not so full that there's no place for them to move to.
>Halllujah! Now we're getting somewhere. Can you please tell this to the
>local TSARC people?

As I've also said before, I speak only about Texas. I have no knowledge
of what the TSARC types are doing, or even who they are. My statement
above (>>s) is true in Texas, and represents the way things are here. I
also have never said otherwise in the case of 220.

In article <30600002@ux1.cso.uiuc.edu> phil@ux1.cso.uiuc.edu writes:
>There is a clear distinction between the functions of a repeater coordinating

>group, and a spectrum planning group.

This is correct. Repeater coordination is only one aspect of spectrum planning; it's merely the most visible one. The reason that almost all spectrum planning groups are also repeater coordinators is because the repeater coordinators were the only groups for a long, long time that recognized the need for spectrum planning.

>However, when a group such as Illinois Repeater
>Association is starting to do spectrum planning, and still only allows the
>owners of repeaters to have voting membership, then I something is seriously
>wrong.

This statement is correct, too, as far as it goes.
Don't throw out all the babies with the bathwater. Not all repeater coordination/spectrum planning groups limit their memberships to repeater trustees.

>That will still leave open the problems of repeaters being spectrum hogs by
>not making an effort to tighten up their spacings, use PL and anti-PL, and
>not consider every case of overlap as interference.

You've seen the discussion I've had here with AA5AV, who considers the interference that his group gets from a repeater 67 miles away to be unacceptable. He's told me in E-mail that a number of his users feel the same way.
PL is a red herring in terms of spectrum management. You can't change the laws of physics with a PL board. A signal strong enough to cause interference will do so whether or not PL is installed; if it interferes with an intended signal with PL, that signal will either be heard along with interference, or it will go away entirely. That's not much of an improvement.

>It still does not solve
>the problem of the repeater owners ganging together for little more than to
>protect their turf.

If you'd invested $2K and a man-year in your repeater, you'd want to protect it too.

>I believe the FCC's decision to not recognize official
>coordinators is correct. Anyone CAN be a coordinator. I am still thinking
>about it.

There was a big war a couple of years ago in Southern California with two repeater coordinators claiming to serve the same area. It led to strife, on-the-air fights, and lawsuits. Do you really want this? The Kowalski letter, stating that it was possible for two coordinators to be in the same area, was an unmitigated disaster. He even said as much, later. Your starting another coordiantion body will 1) be ignored by trustees already coordinated, if you tell them to shut down or move, or coordinate someone on top of them, and 2) do no good for ham radio at large. Please don't. We've had to learn that lesson already. There's no

point in repeating it.

In the UK, it is a condition of the Amateur licence that ALL stations use
a CW ID at most every 30 minutes. Most tnc's tend to send the MyCall callsign
out at about 15-25 wpm, so you can imagine what it sounds like with fifty
or so packet stations on the air together. (More CW than packet!)

Well yes and no - the easiest way is to point you at the
6th ARRL Network Confernce proceedings. The TexNet paper
by Tom McDermott N5EG father of TexNet here in Texas.

I have to run to a meeting - so I will try to post
here in the next few days some points from the paper.

           A monthly forum for ideas about packet traffic handling
                        Jay Farlow, WB9MDS, Editor

AMTOR-PACKET LINKING PROGRAM TO ADD NTS FEATURES
    By Bob Foster, WB7QWG @ WB7QWG

APlink is a bulletin board program which acts as a gateway between AMTOR and packet radio (see IPNN 11/89). Vic Poor, W5SMM wrote the program. An HF traffic handler has requested Vic install special handling for NTS traffic. So Vic has developed a scheme to handle that request. He has only received input from that one individual, and is seeking other opinions.

The following information comes from an excerpt of planned APlink documentation.

The purpose of APlink's NTS features would be to make selected APlink installations a clearing point for NTS traffic being passed between active NTS stations. When activated, these facilities would restrict access for certain NTS traffic to designated NTS stations and provide for automatic confirmation of access and forwarding back to originating stations. The APlink SYSOP would be expected to coordinate with NTS Trans-Continental Corps (TCC) directors, to learn what stations should be allowed NTS privileges.

The proposed software would have specific requirements of operators who enter NTS traffic. If they expect the designated NTS stations to handle the traffic it would have to be addressed to the call sign of the APlink station, or the "@ BBS" field would have to be left blank. For example, where WA8DRZ is the APIINK station, any of the following commands would "capture" a message for the NTS user:

```
ST WA8DRZ
ST NTS
ST WA8DRZ AT WA8DRZ
ST NTS AT WA8DRZ
ST WA8DRZ AT 94062
ST NTSTX AT WA8DRZ
```

In other words, any "ST" message reaching WA8DRZ with WA8DRZ in either the "TO" field or the "@ BBS" field or with a blank "@ BBS" field is considered an NTS message with restricted access and to be cleared by a participating NTS station.

Continuing with this example, messages arriving at WA8DRZ, that are addressed such as the following would be autoforwarded by the APLINK station and would not be treated as restricted NTS messages:

```
ST 78240 AT NTSTX
ST WB7QWG AT WB7QWG
ST WA5QZI AT 78229
```

ANY station would be allowed to ENTER an NTS message. Restrictions would only apply to message ACCESS.

Messages intended to restricted NTS access would have to use the following form (lower case is the APLINK system response):

```
ST WA8DRZ
nr 5678 nts ga msg + ?
NTS WISCONSIN

NR 45 R HXG W7ABC 8 TACOMA WASH 1254Z 23 MAY

ROSEY MAY JONES
321 GARDEN ST
```

GREEN BAY WISCONSIN
404-555-4321

HAPPY BIRTHDAY X SEE YOU SOON X LOVE
TONY

NNNN
nr 5678 filed ga + ?

Note that the "title" or "subject" line is the NTS routing. The first non-blank line following is the standard NTS header.

When a station with NTS privileges enters the command, "NTS," APlink would send a list of all NTS messages that have not been accepted by an NTS station. If the station then reads any of the messages, APlink would send the following prompt:

ACCEPT (YES / NO / CANCEL) + ?

The system would not proceed until one of the three responses is given. A response of YES means that the NTS station accepts responsibility for further delivery and APLINK will mark it as forwarded and delete it from the NTS message list. A response of NO leaves the status of the message unchanged and a response of CANCEL provides the option of removing a message from the system that is unsuitable for amateur handling. In all three cases APlink would generate a confirmation message as discussed below.

The confirmation message would be addressed to the station originating the message into the APLINK system (not the station whose call appears in the NTS header line).

The confirmation will take the following form:

CNF

UR MSG NR 5678 ACCEPTED BY W2DEF 890523/1534Z
NR 45 R HXG W7ABC 8 TACOMA WASH 1245Z 23 MAY

NNNN

The word "ACCEPTED" will alternately be "READ" or "CANCELED" depending on the accessing station's response to the above prompt.

APLINK would hold messages in the system for at least 24 hours after they have been marked as forwarded. Sometime after 24 hours has passed from forwarding, APLINK would remove the messages from the system and archive them. Only the SYSOP could retrieve a message from the archive. A message that remains unforwarded in the system for 21 days would be removed and archived.

Please send comments on these proposed features to WB7QWG @ WB7QWG. If you wish, also send a copy to WB9MDS @ KB8NH, for possible inclusion in a future issue of IPNN.

repeater use? Would the FCC put the kabosh on this?

Technically you can do this. You are still running a repeater on
simplex frequencies which is not the right thing to do. I am trying
to remember now if that is actually illegal or just against band plan.

My belief is that the repeaters on 2m and 440 for packet use are a
short term benefit. Eventually when enough people (computers) are
filling up the digital repeaters then higher frequencies will be more
attractive. This will help fill up 900 MHZ and 1.2G and above.
Remember that this is primarily a point-to-point use with fixed
antennas. Connectivity is through digital switches to other networks.

Assuming, of course, that the PC is sitting there doing nothing but
playing dumb terminal, this makes sense. However, what if the subject
computer _is_ doing something else, like the increasing population of
286- and 386-based Unix boxes? There, it makes sense to offload the
bit-stuffing to another dedicated processor.

>Using PCs for packet in this way has a lot of advantages, not the least
>of which is the enormously easier task of developing experimental
>software.

I can't argue with this one, but it's a comparatively tiny proportion of
those on packet.

>The TNC has served its purpose well, but it was conceived with the
>technology of the middle 1970s in mind. It's time to move on.

Only where it makes sense. My AT is too busy running Unix to do packet
assembly itself.

(Maybe it's too busy *crashing* Unix...^%&$%^$#^%$# Microport... :-)

>Sure, you can squeeze a crossband operation into the area around 147.5
>and again on 450 someplace. But it's not a generalized answer.

Hmmm, this was my original question but I still think you might not
understand what it was. If I take a TRUE FULL DUPLEX PACKET REPEATER
can I have it's input frequency on ...say 145.03 and it's output on
147.555 ??? This would give over 2 mHz of separation and would reduce
the cost of the duplexer due to FEWER cavities and LESS isolation required.
(Fewer... less...??? I think I got it right this time! :-)
The main question here is legality. If you can run simplex packet on
145.03 and also on 147.555... why not the same frequencies for digital
repeater use? Would the FCC put the kabosh on this?

>>2. Most radios today DO support non standard splits.

>Well, neither my FT221 nor TH21AT support odd-ball splits; both use
>discrete crystals for offsets. They're both old, of course; brandy-new
>radios can do oddball splits, but they've gotten costly.

My KDK-2015 does and that predates both that you mentioned.... I see your
point though, I just don't think that it's a big thing. If you wanted to
use either of the radios that you mentioned for dedicated packet use, it
would cost you about $10 or less for a new crystal. But then it wouldn't
be too handy anymore for amateur voice repeater use.... but then....

>>Lastly and as an adjunct, have you read about the proposed idea of using
>>DAMA (Demand Assigned Multiple Access) instead of CSMA on packet radio?

>Lots of problems there. Polling time is too long with T/R switching
>delays; else it's too inelastic of varied demand, it's messy to get
>a node attached, etc. Nice hack concept but I don't think it'll ever
>work for ham radio. Just an opinion of course. CSMA is easier to make
>work. Cheap, too, except of course that the FM boys have a stranglehold
>on the bands in many areas.

No argument... I am not qualified to comment pro or con... but if you
have some time I'd be interested if you could go into a little more
depth on the points that you brought up. I see what you are saying
when comparing it to a full dux system, but with the hidden transmitter
collision problem on a simplex "digi" system it seems to offer advantages
that offset some of the detriments that you mention.   Yes.. No ???

I have two questions about packet.

First...I have seen several ads for commercial TNCs. MFJ,
Pro-Comm and others offer them. What is the difference between
them and the amateur TNCs?

Second...Can I hook more than one TNC to a radio? I am looking at a
mainframe system with several remote terminals and need to connect as many as
eight terminals via radio. I have two options. I can either have several
TNCs off a T-Mux or each TNC on a modem to a Multi-drop input to the mainframe
but do I need a seperate radio for each TNC, or can I hook them
all to one radio?
Any comments suggestions experiences, etc would be helpful.

Please E-mail as I don't always get to read the board all the time
at least right away.

Thanks for any help.

73,
Michael

Many of the commercial TNC's are identical, to the PC board
layout to the TAPR TNC-2. The major advantage is that you
can by them off the shelf and don't have to put them together
or do much alignment in the general case.   Some of the TNC's
have other advantages, either enhanced sofware, smaller packaging,
or addition of an HF modem for HF Packet, AMTOR, and RTTY.
Of course, some of the commercial products cut corners and
leave out very important parts of the TNC-2 design such as
the watchdog timer.

If you are really develloping a multiuser appliation you
probably don't want to use multiple TNC's on the same radio.
You probably don't want to use multiple TNC's on multiple
radios if they end up in close proximity to each other
(besides the additional expense). What you ought to look
into is multiplexing the terminals onto the single TNC
on the host, using either HOST or KISS mode in the TNC
depending on how complex you want to get. This is how
the multiuser bbs's accompish the task, it also gives
you better control than scanning for *** CONNECTED in
your input stream.

I recently downloaded a copy of KA9Q's Net utility. It is a version of
TCP/IP designed to work with ham radio and apparently is being used in
other places on the network.

I am running SCO Xenix 386 2.2.3, as well as SCO Xenix 286 2.2.1.

I would like to see if I can get this utility up and running in some
way on one of my machines. (Preferably the 286). I hacked the
makefile using a Xenix diff file from "conexch" in southern California
(A good Xenix public access system).

All of the routines compile using the makefile designed for Unix with the
appropriate patches, however I get an error with a few unresolved externals
in the final link. These include procedures from slfp.c, pc.c, and maybe
a few other modules in the package. It appears that the makefile doesn't
include these at all as they use non-unix structures etc? I am not really
sure.

At this point has anyone used this package with (1. Xenix, 2. Merit/Telenet,
3. an 80286 machine)?

If anyone could give me any help, it would be appreciated. -- Here is a
little background on why I'd like to get it working.

1. My ham ticket is probably in the mail this very minute (Passed the tech
liscense in early April).
2. I currently get my newsfeed from sharkey (University of Michigan) via
the merit network (X.25 protocol packet switched network that supports TELNET)

I noticed that in the slfp.c file, the Merit network is mentioned specifically.
Since I use it regularly, I'd like to find a better/more reliable way to
get information if I could.

Any help is appreciated.

The same argument I would use in support of a TNC-like box (but running more
advanced protocols) is the argument used to justify the existance of boxes
like ethernet repeaters and terminal servers. Sure, a PC can do what they
do. But a box built just for that purpose can do the job even better in
terms of total cost. Just as Net/ROM is a protocol improvement, I want to
do similar things. I just want a box with a decent processor, a decent
amount of memory, and a decent ROM space. I'll use my PC to develop the
software and burn it into ROMS. Today, they use processors like the 8085.
As the world moves up to 68040 and 80860 technology, TNC-like devices can
move on up to 68000, 80286, and T800 technology for sophisticated, yet
still physically small, automated operations.

The existance of TNC's means their existance was justified. All I ask for
is that they be "open systems". In the ham radio field, this should be more
the case.

> (Fewer... less...??? I think I got it right this time! :-)
> The main question here is legality. If you can run simplex packet on
> 145.03 and also on 147.555... why not the same frequencies for digital
> repeater use? Would the FCC put the kabosh on this?

Since the frequencies in 2 meters that repeaters are allowed on are
    144.5 - 145.5 Mhz and
    146.0 - 148.0 Mhz
that should be legal to do.

Why not suggest a plan for such a scheme. Maybe the simpler scheme of
    144.91 -> 147.41   145.01 -> 147.51
    144.93 -> 147.43   145.03 -> 147.53
    144.95 -> 147.45   145.05 -> 147.55
    144.97 -> 147.47   145.07 -> 147.57
    144.99 -> 147.49   145.09 -> 147.59
at least then the offset will be consistent and the frequencies will be easy
to remember. I don't know if hams will go for that, though.

Have you considered cross-band repeats? That would REALLY simplify the
duplexer, like in almost none.
    223.40 -> 445.50
    223.42 -> 445.525
    223.44 -> 445.55
    223.46 -> 445.575
    223.48 -> 445.60

I've got a couple of questions:

I was in the /atari area on tomcat.gsfc.nasa.gov and there was a file something like "drivers.scc" which explained about an interface and driver s/w for the ST that used a Zilog 5350?. There was mention of a schematic also plus the driver s/w. However all there was in the /atari area about it was that particular teaser info-file.

Does anyone have anymore info about it than that. I would really appreciate the full scoop on this.

Okay on to another question:

How does one invoke the Western Digital packet driver using the attach command for the latest version of net. I don't quite understand quite the idea of the "packet-interupt number". Hate to sound ignorant but I am on this subject. I've been using the beta WD version off louie and I would really like to continue using the WD card with the latest version of net.

thanks,
diana eichert

>playing dumb terminal, this makes sense. However, what if the subject
>computer _is_ doing something else, like the increasing population of
>286- and 386-based Unix boxes? There, it makes sense to offload the
>bit-stuffing to another dedicated processor.

It is worth pointing out that a typical PC consumes much more processing
time just handling the data from a TNC as it comes in on a serial port
than the TNC spends on protocol processing. Even a complete protocol
stack like TCP/IP/AX.25 takes comparatively few cycles. So it makes very
little sense to offload the protocol processing when it represents such
a small fraction of the job.

But I fully agree that the low-level processing of packets (below the
link layer protocol) should be done by dedicated hardware, as long as it
is done in a way that truly improves performance. The unit of
communication between the host computer and the interface should be the
complete packet, as in most Ethernet interfaces. A lot of PCs and larger
computers can easily run UNIX and handle true networking protocols like
TCP/IP at the same time, despite the fact that they communicate at
speeds far higher than the toy 1200 baud rates now used in most of
amateur packet radio

The main problem with the present generation of packet radio adaptors
like the DRSI PCPA, PACCOMM PC-100 and HAPN card is that the host
computer is still forced to handle each byte individually as it comes
in. What's really needed is a "smart card" like K3MC's design that can
operate on complete frames. But even without his card, I still think
you're better off moving the protocol software into the host computer.

>>Using PCs for packet in this way has a lot of advantages, not the least
>>of which is the enormously easier task of developing experimental
>>software.
>
>I can't argue with this one, but it's a comparatively tiny proportion of
>those on packet.

Perhaps it would be a larger proportion if it was made easier. I would

guess that there are already more people experimenting with their own protocol software on PCs than there are working directly on the TNC-2, and the availability of plug-in cards plus the KISS TNC mode is directly responsible for this.

>>The TNC has served its purpose well, but it was conceived with the
>>technology of the middle 1970s in mind. It's time to move on.

>little sense to offload the protocol processing when it represents such
>a small fraction of the job.

How come my AT running Unix slows down whenever I fire up the TCP/IP package? If I get any activity on the channel, the response time for other tasks goes through the roof. Microport's serial handler is notoriously buggy, but it's not all that slow; I don't get such a noticeable slowdown when running uucp to another machine. Your statement about serial processing versus protocol processing is comparing apples and oranges. I'd much rather have my processor spend time on the compile it's working on than on doing protocol-izing; having a 6809 out there do it and hand me the results is much better. Anything I can offload, I will.

>But I fully agree that the low-level processing of packets (below the
>link layer protocol) should be done by dedicated hardware, as long as it
>is done in a way that truly improves performance. The unit of
>communication between the host computer and the interface should be the

...and, strangely enough, like a KISS-based TNC. I'd love to have a TNC
on a board, but I'll run an external TNC before I'll run a
byte-at-a-time packet adapter.

>What's really needed is a "smart card" like K3MC's design that can
>operate on complete frames. But even without his card, I still think
>you're better off moving the protocol software into the host computer.

I'll agree with the first part; that's a TNC on a board. Without the TNC
doing the bit-stuffing, though, the host computer is wasting time on
nonproductive low-level work instead of what it's supposed to be doing.
I don't have a machine I can dedicate to packet; that's part of why I'm
running Unix.

>Perhaps it would be a larger proportion if it was made easier. I would
>guess that there are already more people experimenting with their own
>protocol software on PCs than there are working directly on the TNC-2,
>and the availability of plug-in cards plus the KISS TNC mode is directly
>responsible for this.

You've been hanging around the techies too long. (Well, maybe not too
long in general, but it appears to have distorted your outlook... :-)
Out here in the real world, where people use packet to communicate, they
don't give a fuzzy rat's posterior about software experimentation; they
just want to send packets back and forth. I would tend to believe that
the ratio of software experimenters to users is more like 1:10 or 15.

>>My AT is too busy running Unix to do packet assembly itself.
>Not at all.

Have you run a load study on my system? I'll say it again: My AT is too
busy. It slows down noticeably when asked to run the NET package. That
seems to me to be empirical evidence. I see no way that forcing it to do
even more work can make it less busy.

In reply to Ron's response (ron<at>hardees.rutgers.edu), I didn't intend to
post this, but I apparently can't e-mail directly to Ron:

Thanks for your input, however what I don't believe you realized by my
request was the terminals are in various locations, mostly mobile.
That would preclude muxing the terminals into one TNC. I know you
could have numerous connects on one TNC, as in a rounstable type
discussion, but would that work in this application? I guess
it would be like having a multi-user BBS, but the users would not
see each other.

Thanks again and 73,
Michael

We all know that a TNC has all the brains needed to run packet, so
when will someone come out with a decent and cheap portable terminal
 to use with packet. I mean something we can use, not a 20 dollar VIC-20
or similar where you have to use a TV set, external disk to load the
terminal program etc.
For crying loud, you can buy a spell checker thing that has

64k or so of memory and everything, a nice lcd display rechargeable batteries
and fits into a ladies purse for under 50 bucks. Surely a similar device
with a simple terminal program in ROM and an RS-232 port should be available for
100-150 bucks. Add a battery printer like is in a calculator for another
50 bucks or so and the portable packet folks would jump on it.

TAPR are you listening? Henry radio is on the right track with their new
mobile TNC/printer combo even if it is a bit pricey.

If we are going to be forced into multi-kilobuck laptops, how about
internal TNCs that would go where the internal telephone modem goes?
I think something similar to the DRSI TNC would be nice in a laptop
version, but is the DRSI a complete standalone TNC? Never have
figured out that one yet.

BTW folks, can we get back to real issues on packet/ham radio like
product reviews, operating practices, hardware, new stuff, etc.
These endless 1000 word essays (I think the latest is on repeater
coordination) are getting ridiculus. Please, the few particpants
in these just email to each other so the majority of us can read
the boards with minimal time.

Thanks for listening.

73,
Michael

I have two questions about packet.

First...I have seen several ads for commercial TNCs. MFJ,
Pro-Comm and others offer them. What is the difference between
them and the amateur TNCs?

Second...Can I hook more than one TNC to a radio? I am looking at a
mainframe system with several remote terminals and need to connect as many as
eight terminals via radio. I have two options. I can either have several
TNCs off a T-Mux or each TNC on a modem to a Multi-drop input to the mainframe
but do I need a seperate radio for each TNC, or can I hook them
all to one radio?
Any comments suggestions experiences, etc would be helpful.

Please E-mail as I don't always get to read the board all the time
at least right away.

Thanks for any help.

73,
Michael

If this is happening when just running on a 1200 baud radio channel, I'd
say you have something else wrong. I'm running Phil's code under System
V/AT, and am only using the stock built-in serial ports. I run a
Trailblazer off one port, and have a TNC hung on the other. Even during
UUCP activity at 9600 baud, activity on the radio port doesn't have an
effect on serial throughput. If I try a SLIP link at 9600 baud at the
same time as 9600 baud UUCP activity, there is some degradation -- but
even then it isn't severe.

Gateway: The ARRL Packet Radio Newsletter - Stan Horzepa, WA1LOU, Editor

Volume 5, Number 17 - May 12, 1989 - Part 1 of 4

TAPR UNVEILS packetRADIO AT DAYTON

The Tucson Amateur Packet Radio (TAPR) booth at the Dayton HamVention was buzzing with the unveiling of a number of new packet-radio products including prototypes of the TAPR "packetRADIO," a low-cost (approximately $250) two-stage VHF transceiver designed exclusively for packet-radio applications. TAPR's packetRADIO features 9600-baud FSK and 1200-baud AFSK 2-meter operation with 25 watts output, five crystal-controlled channels and a transmit-receive turnaround time of less than one millisecond (ms).

The working prototypes displayed at the HamVention were the result of a six-week crash project by TAPR. Beta-testing will begin soon with the radios expected to be available to the general public in approximately six months. [TAPR is looking for beta testers. If you are interested, send an SASE to TAPR (PO Box 12925, Tucson, AZ 85732) for a beta-test questionnaire.] For more information concerning the packetRADIO, see the accompanying story entitled "packetRADIO - The Missing Link."

In addition to the unveiling of the packetRADIO, the "TNC 1 to TNC 2 upgrade" kit was sold at the TAPR booth for the first time. The kit consists of a printed-circuit board that is piggybacked on a TNC 1, which results in a TNC with all of the capabilities of a TNC 2 and a TNC 1. See Gateway, Volume 5, Number 10, for the complete description of the upgrade kit.

Also available at the TAPR booth were the "DCD mod" kits that are intended to improve the operation of Data Carrier Detect (DCD) in a TNC. (DCD is used to determine whether a channel is clear in order that a TNC may send packets without interference. If DCD is on, the TNC remains in the receive mode. If DCD is off, the TNC may transmit after all its timing requirements are met.) Most TNCs base DCD on the presence of "some sort of signal or noise." When the TAPR DCD modification is installed in a TNC, DCD is based on the presence of "coherent information." As a result, a channel may be used more efficiently because the TNC is not falsely prevented from transmitting by a signal or noise that is not a legitimate packet-radio signal.

The DCD mod kits are available in two flavors. The "2211 DCD upgrade" kit

is intended for TNCs using the XR2211 modem receiver IC such as the TAPR TNC 1 and TNC 2 and their clones. The "state machine DCD upgrade" kit is intended for TNCs using other types of modems such as the Kantronics and AEA PK-series TNCs.

Besides new hardware, new software was also available at the TAPR booth as new versions of the KA9Q TCP/IP code for IBM PC and compatible computers (Version 890421.0) and Apple Macintosh computers (Version 871225.33a4) were distributed at the TAPR booth during the HamVention. For more information concerning the Macintosh release, see the accompanying story entitled "New Version of Macintosh KA9Q TCP/IP Code Released."

packetRADIO - THE MISSING LINK

Something has been missing from packet radio... a radio designed specifically for the average amateur.

Why 9600 bit/s?

Most VHF amateur packet-radio operations use 1200-baud modems with radios designed for voice use. With few frequencies available for packet-radio use, today's channels are becoming extremely crowded. Packet radio is almost unusable in some metropolitan areas during evening hours.

Sending data faster allows more users to operate on a given channel. And 9600-baud packets can be easily encoded using FSK techniques and fit within a normal 2-meter FM channel. But, a faster modem running with a voice radio is a compromise at best.

Why a Special Radio for Packet Radio?

The typical VHF packet-radio station uses an FM transceiver designed for voice use. There are four major drawbacks to using such radios.

1) Timing. Voice radios have receive-to-transmit and transmit-to-receive turnaround times of about 150 to 400 ms. This dramatically reduces the amount of data that can be sent and increases the chance that two or more stations will interfere with one another.

   At 9600 bauds, a radio that switches in 1 ms can transfer files about 20% faster than one which switches in 200 ms. Similarly, a channel can accommodate four times as many users if the radios switch in 1 ms instead of 200 ms. At data rates faster than 9600 bauds, the differences are even more dramatic.

2) Interfacing. The modem-to-radio interface depends on audio response, filters and audio levels intended for microphones and speakers. More often than not, this leads to incorrect deviation of the transmitted signal, noise and hum on the audio, and so forth. Splatter filters and deviation limiters distort frequency response and further reduce the performance of the packet-radio system. Higher-speed operation (such as

9600 bit/s) involves surgery on the radio--there is no proper interface.

The TAPR packetRADIO has built-in 1200-baud and 9600-baud modems. It plugs directly into a standard TAPR TNC modem disconnect. Its filters are optimized for data operation, not voice.

3) Complexity. The typical VHF radio manufactured today is competing in the voice market and includes many additional features which are simply not necessary in a data radio. These include telephone tone pads, scanners, digital readouts, squelch, voice synthesizers and miniaturization. In fact, these additional features often detract from the performance of the radio in data applications.

4) Price. The usual VHF FM transceiver sells for $400 or more in today's market. A dedicated digital transceiver can be made to significantly outperform existing voice-grade radios for data use and at a substantially lower price. It makes good economic sense to free up a multifeatured radio for voice operation and use a simple, inexpensive data radio for digital applications.

TAPR's packetRADIO has the following features that are designed for experimentation.

- Design is easily adaptable for higher frequencies.

- Each major subsection of the radio is on a separate printed circuit board for optimum performance. This results in the ability to upgrade to other frequency bands.

- The modems are modular. Higher-speed operation to 56 kbauds and beyond is possible.

- The basic RF deck may be used for modem experimentation.

- May be used with a transverter for higher frequencies and higher baud rates.

NEW VERSION OF MACINTOSH KA9Q TCP/IP CODE RELEASED

The new version of the KA9Q TCP/IP code for Apple Macintosh computers (Version 871225.33a4) was released at the Dayton HamVention. This release features the following changes.

- Separate windows for the Console, Trace and Log functions.

- Fully MultiFinder friendly.
- MacBinary file transfers within FTP.
- Support for NET/ROM.
- Support for AppleTalk.
- Addition of finger command.
- Command key mapped as the Control key for non-ADB keyboards.
- Extensive help files built into MacNet and MacBM.
- Mailbox facility for AX.25 commands.
- MHeard facility for AX.25 commands.
- Alias file support in MacNet and MacBM.
- Full path name support including foreign volumes.

DAYTON NOTES

In the last ten years, I have attended the Dayton HamVention seven times and my 1989 attendance was the best one yet. The HamVention opened with a bang Friday morning as a spectacular thunderstorm engulfed the HamVention area. It was the first time I have witnessed such a storm while sitting in a car and the lightning strokes were the most spectacular I have ever seen especially the jagged horizontal strike that looked like an oscilloscope display. Despite the storm, some HamVentioners were working their way through the flea market checking out the goodies of the few booths that dared to open during the storm. There were other storms during the weekend, but none interfered with my attendance at the convention. My only worry was whether my rental car would get stuck in the mud quagmire that also served as a parking lot.

It was a pleasure meeting some folks for the first time after dealing with them over the air, landline or mail and it was nice to reaquaint myself with folks I have eyeballed in the past. Sorry if I missed anyone.

The most fascinating new stuff at the HamVention for me were TAPR's packetRADIO and ICOM's IC-3SAT (I, like many others would have bought one of each on the spot if they were for sale). The packetRADIO you can read about elsewhere in this issue, the ICOM IC-3SAT you can read about here.

It is a miniature 220-MHz handheld (1.9 X 4.0 X 1.4 inches) that is not much bigger than a pack of cigarettes and includes memory storage for 49 operating channels and 15 telephone numbers, 5 watts output when run on an external supply, a scanner and a clock that can be programmed to turn the transceiver on and/or off. It is supposed to be available in June.

Since I could not buy a packetRADIO or IC-3SAT, what did I buy? Besides the odds and ends that I obtained (tie wraps, books, battery packs, etc.), my major purchases were a Kenwood TM-621A and a TNC 1 to TNC 2 upgrade kit. The 621 will free up the 220-MHz radio I use in my car which I plan to hook up inside for 220-MHz packet-radio operations.

I enjoyed the packet-radio forum, however, next time I will bring a tape recorder along to record the festivities instead of trying to take notes that, less than a week later, are somewhat inscrutable. I also enjoyed the various hospitality rooms in Stouffers. Although, it seemed that every floor of the hotel had a hospitality room on both Friday and Saturday nights, I never got off the fifth floor where my room was located.

It was a fun weekend! I hope for more of the same in 1990!

GATEWAY CONTRIBUTIONS

Submissions for publication in Gateway are welcome. You may submit material via the US mail to:

   Gateway
   Stan Horzepa, WA1LOU
   75 Kreger Drive
   Wolcott, CT 06716-2702

or electronically, via CompuServe to user ID 70645,247. Via telephone, your editor can be reached on evenings and weekends at 203- 879-1348 and he can switch a modem on line to receive text at 300, 1200 or 2400 bit/s.

The deadline for each issue of Gateway is the Saturday preceding the issue date (which is typically a Friday).

REPRODUCTION OF GATEWAY MATERIAL

Material may be excerpted from Gateway without prior permission, provided that the original contributor is credited and Gateway is identified as the source.

> The main question here is legality. If you can run simplex packet on
> 145.03 and also on 147.555... why not the same frequencies for digital
> repeater use? Would the FCC put the kabosh on this?

Since the frequencies in 2 meters that repeaters are allowed on are
    144.5 - 145.5 Mhz and
    146.0 - 148.0 Mhz
that should be legal to do.

To me it seems like these are simplex frequencies being used for
repeater operation. Of course another way of looking at it is packet
channels being used for packet....

Have you considered cross-band repeats? That would REALLY simplify the
duplexer, like in almost none.

And the really great part is everyone would need 2 radios (or one dual
band) to dedicate to packet... :-)

> Most TNCs base DCD on the presence of "some sort of signal or noise." When
> the TAPR DCD modification is installed in a TNC, DCD is based on the presence
> of "coherent information."

Could someone please describe the changes to the circuit? How did they improve the detection process? Are they using some sort of scheme that uses an amplitude/duration threshold to determine data from noise?

Detecting `coherent information' implies knowing something about the incoming data stream. It seems to me that the output from a detector being fed with noise is very dependent upon the input noise level and the detection threshold. Given the wide range of input noise levels possible, it seems difficult to distinguish input noise and a real signal, short of using heuristics (e.g. NRZI guarantees input transitions through bit-stuffing).

The only other thing I can think of off-hand is that we know something about the spectrum of a Bell 202 signal, and we know something about the spectrum of noise (or should I say, a band-limited noise source). Using this information, we should be able to detect the difference between noise and a known signal by comparing the spectrums (hence detection). Are they doing some sort of `noise detection' and using this as a threshold for detecting (gating) a real signal?

Mike

Real Programmers Don't Write Specs

Real Programmers don't write specs -- users should consider themselves lucky to get any programs at all and take what they get.

Real Programmers don't comment their code. If it was hard to write, it should be hard to understand.

Real Programmers don't write application programs; they program right down on the bare metal. Application programming is for feebs who can't do systems programming.

Real Programmers don't eat quiche. In fact, real programmers don't know how to SPELL quiche. They eat Twinkies, and Szechwan food.

Real Programmers don't write in COBOL. COBOL is for wimpy applications programmers.

Real Programmers' programs never work right the first time. But if you throw them on the machine they can be patched into working in "only a few" 30-hour debugging sessions.

Real Programmers don't write in FORTRAN. FORTRAN is for pipe stress freaks and crystallography weenies.

Real Programmers never work 9 to 5. If any real programmers are around at 9 AM, it's because they were up all night.

Real Programmers don't write in BASIC. Actually, no

programmers write in BASIC, after the age of 12.

Real Programmers don't write in PL/I. PL/I is for programmers who can't decide whether to write in COBOL or FORTRAN.

Real Programmers don't play tennis, or any other sport that requires you to change clothes. Mountain climbing is OK, and real programmers wear their climbing boots to work in case a mountain should suddenly spring up in the middle of the machine room.

Real Programmers don't document. Documentation is for simps who can't read the listings or the object deck.

Real Programmers don't write in PASCAL, or BLISS, or ADA, or any of those pinko computer science languages. Strong typing is for people with weak memories.

Real programmers never make up schedules. Only planners make up schedules. Only managers read them.

Real programmers never deliver programs on schedule. Either the program is "done" in two days or it is never finished. In any case, it is never delivered when it was scheduled.

Real programmers never eat at restaurants. If the vending machine sells it they eat it. If it doesn't, they don't. Recently real programmers discovered that popcorn was being sold in vending machines. Common coders discovered that it could be popped in the microwave oven in the vending- machine room but real programmers use the heat escaping from the top of the CPU.

Real programmers never deliver programs on Wednesdays. Real programmers never deliver programs on the first day of any month.

Real programmers know that good human factors design requires only the application of common sense. Besides, no one cares about users. The program's written for aesthetic beauty.

Real programmers know every nuance of every instruction and they use them all in every program.

Real programmers do not clear registers twice before using them. In fact, if you annoy a real programmer, he/she won't clear the registers at all. And that goes for your memory too!

Real programmers do not wonder where the bits went following a shift operation. They do not care.

Real programmers are not in it for the money. Most of them are secret millionaires.

REAL SOFTWARE ENGINEERS DON'T READ DUMPS

Real software engineers don't read dumps. They never generate them, and on the rare occasions that they come across them, they are vaguely amused.

Real software engineers don't comment their code. The identifiers are so mnemonic they don't have to.

Real software engineers don't write applications programs, they implement algorithms. If someone has an application that the algorithm might help with, that's nice. Don't ask them to write the user interface, though.

Real software engineers eat quiche.

If it doesn't have recursive function calls, real software engineers don't program in it. Real software engineers don't program in assembler. They become queasy at the very thought.

Real software engineers don't debug programs, they verify correctness. This process doesn't necessarily involve executing anything on a computer, except perhaps a Correctness Verification Aid package.

Real software engineers like C's structured constructs, but they are suspicious of it because they have heard that it lets you get "close
to the machine."

Real software engineers play tennis. In general, they don't like any sport that involves getting hot and sweaty and gross when out of range of a shower. (Thus mountain climbing is Right Out.) They will occasionally wear their tennis togs to work, but only on very sunny days.

Real software engineers admire PASCAL for its discipline and Spartan purity, but they find it difficult to actually program in. They don't tell this to their friends, because they are afraid it means that they are somehow Unworthy.

Real software engineers work from 9 to 5, because that is the way the job is described in the formal spec. Working late would feel like using an undocumented external procedure.

Real software engineers write in languages that have not actually been implemented for any machine, and for which only the formal spec (in BNF) is available. This keeps them from having to take any machine dependencies into account. Machine dependencies make real software engineers very uneasy.

Real software engineers don't write in ADA, because the standards bodies have not quite decided on a formal spec yet.

Real software engineers like writing their own compilers, preferably in PROLOG (they also like writing them in unimplemented languages, but it turns out to be difficult to actually RUN these).

Real software engineers regret the existence of COBOL, FORTRAN and BASIC. PL/1 is getting there, but it is not nearly disciplined enough; far too much built in function.

Real software engineers aren't too happy about the existence of users, either. Users always seem to have the wrong idea about what the implementation and verification of algorithms is all about.

Real software engineers don't like the idea of some inexplicable and greasy hardware several aisles away that may stop working at any moment. They have a great distrust of hardware people, and wish that systems could be virtual at ALL levels. They would like personal computers (you know no one's going to trip over something and kill your DFA in mid-transit), except that they need 8 megabytes to run their Correctness Verification Aid packages.

Real software engineers think better while playing WFF 'N' PROOF.

Real Computer Scientists Don't Write Code

Real computer scientists don't write code. They occasionally tinker with 'programming systems', but those are so high level that they hardly count (and rarely count accurately; precision is for
applications.)

Real computer scientists don't comment their code. The identifiers are so long they can't afford the disk space.

Real computer scientists don't write the user interfaces, they merely argue over what they should look like.

Real computer scientists don't eat quiche. They shun Schezuan food since the hackers discovered it. Many real computer scientists consider eating an implementation detail. (Others break down and eat with the hackers, but only if they can have ice cream for dessert.)

If it doesn't have a programming environment complete with interactive debugger, structure editor and extensive cross module test checking, real computer scientists won't be seen

tinkering with it. They may have to use it to balance their checkbooks, as their own systems can't.

Real computer scientists don't `write` in anything less portable than a number two pencil.

Real computer scientists don't debug programs, they dynamically modify them. This is safer, since no one has invented a way to do anything dynamic to FORTRAN, COBOL or BASIC.

Real computer scientists like C's structured constructs, but they are suspicious of it because its compiled. (Only Batch freaks and efficiency weirdos bother with compilers, they're soooo un-dynamic.)

Real computer scientists play go. They have nothing against the concept of mountain climbing, but the actual climbing is an implementation detail best left to programmers.

Real computer scientists admire ADA for its overwhelming aesthetic value, but they find it difficult to actually program in, as it is much too large to implement. Most Computer scientists don't notice this because they are still arguing over what else to add to ADA.

Real computer scientists work from 5 pm to 9 am because that's the only time they can get the 8 megabytes of main memory they need to edit specs. (Real work starts around 2 am when enough MIPS are free for their dynamic systems.) Real computer scientists find it hard to share 3081s when they are doing 'REAL' work.

Real computer scientists only write specs for languages that might run on future hardware. Nobody trusts them to write specs for anything homo sapiens will ever be able to fit on a single planet.

Real computer scientists like planning their own environments to use bit mapped graphics. Bit mapped graphics is great because no one can afford it, so their systems can be experimental.

Real computer scientists regret the existence of PL/I, PASCAL and LISP. ADA is getting there, but it is still allows people to make mistakes.

Real computer scientists love the concept of users. Users are always real impressed by the stuff computer scientists are talking about; it sure sounds better than the stuff they are being forced to use now.

Real computer scientists despise the idea of actual hardware. Hardware has limitations, software doesn't. It's a real shame

that Turing machines are so poor at I/O.

Real computer scientists love conventions. No one is expected to lug a 3081 attached to a bit map screen to a convention, so no one will ever know how slow their systems run.

> something that I can put mod's on if possible. Our company runs it's trucks at 463.712Mhz, and I can legally transmit and recieve there because of this fact (not on my ham licence). Anyway, if I could get a 2m/440 HT that would expand up to the 460+ Mhz range it would be very desirable.

Sure, you can transmit on your commercial frequency, but only with something that is FCC type accepted for that use. Most ham rigs aren't, so you probably won't be able to legally use your ham HT to talk to your trucks. This is a common mistake.

> Second, I see a few ALL MODE packet radio devices on the market. Could someone please recommend their packet system to me? I want to run KA9Q's package on a 286 or 386 box running under SCO Xenix. I have seen AEA's PK-232, and the Kantronics All Mode in magazines, however have seen no one with personal experience on the boxes. Obviously I'd like something that can run KISS because I want to run KA9Q (unless I am missing something).

I'll reiterate the advice that Phil Karn gave me about a year ago: If all you are interested in is running the KA9Q TCP/IP software, don't bother spending the big bucks on an all-mode TNC. You can pick up a TNC2-clone for <$100 at a flea mkt, and a new one for not much more. Buying an all-mode TNC would be a waste of features (and money) if all you're doing is running NET. If you ever need those other modes, you can get a KAM/AEA at that timee. But odds are, if you do, you'll probably have a full-time packet station with a dedicated TNC (ie, the simple one you orginally bought).

Good luck!
Dan, N1FMK

(forwarding comment)

Howard Leadman, N8KUD and the readers of "PACKET-RADIO"

RE: 2-M, 70-CM HT Selection

Howard, I too went through the same process you are with respect to looking into HTs, especially the new dual-banders.

Attached is the same question I asked the "INFO-HAMS" net and a few of the responses I received.

Good Luck!

73,

Marty, KB5JDQ

(original message follows)

RE: DUAL-BAND HT FEEDBACK

Earlier this month, I asked the INFO-HAMS "world" a question pertaining to dual-band HTs. I got such a good response to my inquiry, I thought I'd share a few of my my "answers" back with the INFO-HAMS group. Hopefully, this feedback will be of benefit to someone.

My initial inquiry went as follows:

ATTN: DUAL-BAND HT OWNERS!

I'm in the market for a dual-band HT and want to know if any of y'all have had any experience, good or bad, that I may profit from?

I'm leaning toward the YAESU FT-470 because of its price, size, memory management features and autopatch auto-dialer. Also looking at ICOM's IC-32AT and the new KENWOOD TH-75A. The FT-470 is the least expensive of the three (I found a source that quoted me $479). I've always been an ICOM-man in the past, but I have an open mind.

Candid owner/operator comments are what I'm looking for. If you had it to do all over again...which rig (if any at all) would you go with? Any regrets in going dual-band on a HT platform? Etc., etc., etc.

With the price of these rig's being what they are, I need to do it right the first time!

THANKS!

Martin Mullican, KB5JDQ

Here are some of the responses I got from you, the INFO-HAMS folks.

Martin,

I purchased the Icom IC-32AT at Dayton Hamfest. I had looked at and talked to the owners of all the dual band talkies. When I started looking I had a strong bias towards the Icom because of the accessories that I already had. At Dayton I saw the Yaesu 470 and several hams that I know bought them outright. After playing with one for a while I almost went inside and bought one but then I stopped and talked to the fellow that is at most of the major hamfests who does all the mods to the radios. When I found out all the things that he could make the 32AT do I decided to go ahead and get one and also protect my investment in Icom accessories. One of the mods that he makes converts the 32AT into a cross band repeater without any external hardware. I bought it from Universal Amateur Radio in Reynoldsberg Ohio for $499. I did buy the Yaesu 4700 mobile dual band radio though.

Randy Jarrett WA4MEI

Martin:

I have owned a Yaesu FT-727R for about a year now and love it. However, it is nothing compared to the new 470.

The dual band HT is great and I don't think I would sacrifice it for anything else. Even though you lose some of the convenience of a small package that is available in some of the mini-HT single band rigs, the performance that most dual bands offer is much superior.

I am trying to sell my 727 so that I can move up to the 470 quite soon. One of my close friends bought the 470 in Dayton and he loves it. It has more features on it that all of his other equipment combined! Five or six of the other guys in my repeater group have ordered or are planning on ordering one within the next few months.

On the other hand, one of our group bought the Icom 32AT and is very happy with it, although it doesn't have as many bells and whistles.

Getting off the subject, would you know of any of the crews from your base coming up to the London International Airshow on June 3 & 4. We are setting up a special events station and would like to get this out to a few of the crews to see if we can get some good contacts. Any help would be appreciated!

Hope this info is of some help.

73 de VE3ZDC...Dave Colvin
Univ. Western Ontario, London, Ont., Canada

Martin:

I own a ICOM 32AT .. and could not be happier with it. This HT has given me no trouble at and has EVERY feature you could possibly want. This bulletin board has had some horror stories lately about the Yaesu HT, and has for the brand new Kenwood HT .. I would wait a year before buying it. I know that the 32AT is a little pricy ... but believe me ... it is well worth it.

Fred J. Stellabotte - N2JCD

Martin,

If you've "always been an Icom man", you'll find the IC-32AT satisfying, and will continually wonder upon hearing all the HT-of-the-week weenies talking about the more-memory, more-features Yaesu and Kenwood handhelds whether you've done the right thing after all. Until you start dropping the set off tables, onto driveways, and the like. Now, I'm told that the small-format Kenwoods withstand similar abuse well in their own right, although those I've seen that have been the unplanned objects of such "testing" do end up a bit more scarred from the experience than the Icoms (an ABS vs. Icom's polycarbonate case would seem to be the reason). As an Icom man, you already have a complement of accessories, all of which will work with the '32 (obviously excluding the DC adaptor for the older 10.8v models); get another manufacturer's HT, and welcome to the land of extras all over again (and if you thought Icom accessory prices were a bitch, add another five or ten percent and you've got Kenwood prices).

I got my '32 in February and as you can guess, am pleased with it. I have noticed that the receiver appears to be a tad less sensitive than the '02 on 2m and my Yaesu FT-708R's on 70cm, and (corroborating someone's recent posting on rec.ham-radio) the s-meter is stupidly over-scaled ("s9" readings with the squelch not set high but still closed are irksomely common). The dual-band antenna (like all dual-band HT antennae I've ever seen) is the weak link in the tumbling-drop scenario, and with any dual-band HT, should probably be considered a consumable item, hi. The available soft case isn't quite as nice as the older soft cases with their fabric seam-reinforcements, both in terms of looks and utility (I ceased dicking with the top flap that's a separate piece on the new case and which opens rearward, in fact must be opened to get to the keypad; I have thrown it into the junk box after finding that even after mods with an x-acto knife, it still is a nuisance). Icom decided to use up their inventory of belt clips left over from the micro-nAT line by incorporating them into the '32's design, and these are a minor liability in that under the wrong circumstances, they can bend open if the rig snags on something while

still mounted on your belt (and the snag-likelihood is enhanced by the clip's design's causing the radio to ride 1/4" to 1/2" lower on your hip). I've noticed that if you are feeding DC station power to the rig into the top jack, if that power is interrupted (e.g., by jiggling the plug), the set is prone to lose information that you've stored in memory (not a problem if you are careful never to insert/remove the plug unless the set is switched off first, and I've not yet had any problems from mobile vibration with the power plug; I encountered the memory-loss-from-power-glitch phenomenon when heavy-handing the plug in the shack only).

Not being constrained by a choice of obsolete microprocessor technology in the design (as the later '02AT et al were), Icom has been able to update the control software while maintaining the good parts of its old look-and-feel. You'll find operation of the set will come to you quite naturally if you've been using '0n series sets. The three jacks on the top panel are now mounted in a rubber block that provides a nice extra cushion against physical shock (the mic jack on my '02 worked loose and now keying through it is intermittent; I don't anticipate ever having this kind of problem occur with the '32). The rubber caps for the jacks are now captive instead of eminently loseable; only the BNC cap is detachable, and the BNC is now recessed into the top plate, so this one is less likely to go flying away when you detach from things in a rushed situation. Battery consumption seems to be on a par with my '02AT (I use BP-8 or CM-8 packs almost exclusively). One odd observation is that when the battery is low, it will die on 2m transmissions (and the display will flash when the transmitter is keyed) but will continue to transmit on 70cm for a good while longer (on 70cm, when the transmitter is keyed, the "TX" led will light and immediately go out instead of staying lit, and full power seems to be developed anyway, until the battery really is down). The '32 receive audio is louder than the '0n's, which is a mixed blessing in light of the dirty squelch tail (no dirtier than the older Icoms, just more obtrusive now when making use of the capability to turn it up louder).

I hope this top-of-the-head user report proves useful to you. Let's hear what you ultimately decide to get. Good luck!

73 de KB6OWB!
Harris

Martin,

I have been the somewhat satisfied owner of a Yaesu FT-470 for 3 weeks now. Their are a few things wrong with the rig that I flat out believe are due to dumb engineering. The radio *IS* a pretty nifty rig on the whole, however.

First off, the few things mentioned on INFO-HAMS have been checked out by me, KB7Z, and N7CTM. We all possess 470's. My rig and KB7Z'z are consecutive serial numbers 90243 and 90244. Having a rig out of the first thousand can have it's drawbacks.

The problem about the 17.3 MHz IF is indeed true. Our local NOAA weather station is on 162.475. I took my FT-23 and dialed up 145.175 (in the band plan allocated to linear translator outputs, none in this area) and sure enough when I keyed the transmitter, NOAA popped out on the FT-470. It could be a big problem for people in Cincinnati... Better engineering could have prevented that problem.

The second OH FU I have found is annoying because it's a goof that I feel only a novice or an engineer with a deadline would make. If the radio is *NOT* receiving a signal on *EITHER* band, the speaker is totally silent. No problem. Just what you'd expect. If you are monitoring both bands with one band inactive and the other band receiving a nearly full-quieting to full-quiet signal, you can hear the unsquelched inactive band audio about 20 to 30 db down under the audio from the active receiver. I think any sane engineer would have designed the radio such that an inactive receiver would have it's audio completely muted going into the audio mixer. If you are outside or in a car, it isn't really noticeable unless you are listening explicitly for it. Indoors in a reasonably quiet room, you can't really avoid hearing it. Some people think the received signal isn't full quieting. I haven't been out to the shop yet, but one of these days when I am, I'm going to hook it up to the communications monitor and measure the level of the squelch noise and write YAESU a nasty-gram. Actually, I'm told that Yaesu knows about some of problems and is going to do some corrective engineering. It wouldn't hurt to call them (1-213-404-2700 or I think 1-800-999-2070) and mention the problems and see what you can find out. Maybe they'll get enough abuse that they *WILL* fix them.

On the other hand, the features designed into this rig make it very desireable. Since we don't have local repeater outputs screwing around with local WX stations in the receiver front ends, the first problem *isn't*. I live with the squelch mute problem by baising the balance control toward the primary band which helps. The new Kenwood HT has only two channels on each band that carry "odd" splits. All others have to conform to band plan. :-(= It only has 20 memories per band, as I recall. The Yaesu has 21 memories/band *ALL* of which can be programmed for any split. The "standard" split selected is changeable. The offset is also changeable. It will store ten 15-digit phone numbers in the autodial memories. The frequency increment in VFO mode is programable as well.

Where I work, we hold a license in the Experimental Radio Service for about a dozen frequencies between 152.0 and 159. MHz. The license limits us to a power level of which I can't recall (25 watts?) and has a waiver on the type acceptance requirements. The only requirement is that its up to *US* to correct any interference problems that we cause. We build and use a lot of little 1 watt transmitters to remotely acquire data in the field for our research. Hence, I am awaiting the Technical Manual (supposed to be available in June) to see if (1) it can be modified

for out-of-band transmission and (2) it will cross-band repeat.

In closing, I must say I really have no regrets that I purchased the FT-470. I have already found it very convenient vs packing around either my FTH-2005, FT-23R, or FT-73R. KB7Z has a Kenwood UHF handheld (I can't recall the model. He preferred it to the FT-73R, but now carries his FT-470 around. He also has and likes his Kenwood 721 Dual Band rig, so he isn't really biased one way or the other unlike me. I'm an old Icom man, too (IC-230, IC-22A, IC-2AT).

Since I'm starting to ramble I'll close this out. Hope you find this of some use.

73,
Reid

Martin,

I have the ICOM, and would do it again. The Yaesu and Kenwoods aren't up to the Icom in quality. The Yaesu is very attractive, I'll admit. I've never owned any other units, so this isn't worth a lot.

Martin:

I too have just went through the dual-band HT study. I was serious about the YAESU FT-470, but after talking to several people who are strong YAESU fans, I had second thoughts.

They always seem to have one problem after another. You will also notice a lot of notes bandwidth concerning image problems that this new model has.

Many of the local ARES and CAP groups use ICOM and swear by it. I was convinced, and bought the ICOM 32AT and LOVE IT!!

Jeff, WO0J

In closing, let me say THANKS for all your help folks!

73,

Martin Mullican, KB5JDQ
Kelly AFB MARS
San Antonio, TX

P.S. I bought the ICOM!

Those two frequencies are within the reepeater subbands, so they
don't violate FCC regs. 145.55 is not. The middle of each of the
three 2m repeater subbands is traditionally simplex because of
the 600 kHz split. So an odd-ball repeater just runs into the
possibility of simplex interference.

    So, exactly what you want may or not be out there. You want a $100.00 dollar portable packet terminal? Have you looked at a used TRS-100 laptop? Olivetti and NEC used to sell the same thing under different model names. These devices will do what you want. I use a laptop (Toshiba T1100P) for my portable packet which is probably overkill. But for about $300 you could find a used T1000 which is a single drive unit that can give you Wordstar for off line editing, plus Procomm, YAPP or your favourite comm prog and editor.

    You may find though that using a small simple laptop like the TRS-100 is a real pain. Reading a 40 col 3 row display is pretty tricky, expecially when stuff is scrolling by at a fair clip. The word processor and comm programs are a bit tricky and limited. I find the spelling thesaurus machines limited too.

    Also if you get a real laptop running real MS-DOS, you can use it for

other things too. WOW! you can even call into the big Unix machine at home
and do mail news and use vi. Dont try that from a 40 col tiny laptop like a
TRS-100. I have never regretted getting an MS-DOS laptop. I use it all the
time and even schlep it to clients to do work at their site and also to
upload/download software to computers and even PBXs. You will find more uses
for an MS-DOS laptop than a full set of Ginsu knives.
>

I have started to get interested in working packet on the HF bands...
What frequency ranges are the most active?

Also, how much HF packet is present on HF? Is RTTY better or more
popular?

I need some help configuring the KA9Q TCP/IP package. I've used the
package with great success on packet radio.

I now want to try it on an ethernet using a WD8003E ethernet interface
card. I don't have any documentation describing how to use the new
packet driver software.

Here is what I think is required:

1) Install the wd8003e driver:

    wd8003e packet_int_no hdw_int_no io_addr mem_base

2) Setup a proper autoexec.net file:

    attach packet packet_int_no interface_label max_#_packets mtu

3) Start net.exe

My problem seems to be in selecting a proper "packet_int_no". I am
guessing that this is actually the software interrupt vector to be used
to access the packet driver. I know very little about MS-DOS, so I'm
not sure what a reasonable value might be. The rest of the arguments
seem pretty obvious, except for "interface_label". I'm not sure what
that should be.

I'm running the 871225.31 version of "net.exe". I hope someone out
there in netland can help me out. I have the packet driver
documentation from FTP Software, Inc., but it doesn't seem to answer
these particular questions.

>We all know that a TNC has all the brains needed to run packet, so
>when will someone come out with a decent and cheap portable terminal
> to use with packet.

I hope you are being facetious. Your typical TNC has a Z-80 for a brain.
Z-80s are now about 13 years old and hopelessly out of date. It seems
quite clear that we need to get rid of the TNC as a separate box and
move its functions into general purpose computers. Laptops are now entirely
capable of running a true computer networking protocol suite such as TCP/IP.

>TAPR are you listening?

I do not believe that the limited time and resources of the amateur
community are well spent on developing computer hardware that can be bought
off the shelf (terminals, computers, etc). We need to concentrate on
building that which cannot be bought off the shelf (for reasonable prices,
anyway).

Paul,

You guess correct. These vectors should range from 0x60 to 0x80; my
personal favorite is 0x7e.

Regarding the interface label: this can be any name you wish. It is needed
so that you can refer to the interface in "route add" and "trace" commands.
My favorites are "com#" for asynch SLIP/KISS ports, and "ethernet" for
an Ethernet controller.

Jay Splut asks:

>>How come my AT running Unix slows down whenever I fire up the TCP/IP
>>package?

The reason is that the KA9Q NET implementation for System V is a hack job;
it runs as an application in user space. Because NET has to deal with
several I/O streams, and because System V lacks an equivalent to the
Berkeley select() system call, it has no choice but to poll each device

continuously in "no delay" mode. This soaks up all available CPU time and steals time from other processes, even when nothing is happening on the network.

The proper way to implement TCP/IP in a UNIX system is the way Berkeley did it: in the kernel, under a decent interprocess communication mechanism, e.g., sockets. Unfortunately, sources are generally not available for System V so this is not something you can do very easily. But when it's done right, it works quite well; the TCP/IP protocol processing overhead is minimal compared with the overhead of handling an 8250-style character-at-a-time serial channel.

If you don't believe me, try testing the throughput of my TCP code under MS-DOS in software loopback mode. (Be sure to comment out the disk accesses, though; I've found that hard disk I/O speed is the main limitation on the speed of a file transfer.) Then scale the resulting throughput figure down to 1200 baud (or whatever speed packet channel you're using) and figure what percentage of the CPU that represents.

(On my own system, a 10 MHz AT clone, I get speeds of about 120 Kbytes/sec. This isn't the fastest TCP available for the PC, but I do think it's sufficient for amateur packet radio.)

Because I run NET under sysV on an HP9000/550 (an obsolete but ironclad unix box) that has separate I/O processors, I had never noticed this. It turns out that the way the current sysV drivers are set up in NET to handle the serial ports is about as stupid as you can get, and NET will eat as much CPU as is available while eating packets. This is an implementation defect, not a valid argument against the offered conceptual model.

A couple of folks have offered fixes, after I get back from next week's vacation I'll see about integrating one as part of the .2 patches.

>I don't have a machine I can dedicate to packet; that's part of why I'm
>running Unix.

No problem. My unix machine services a modem, several slip links, two TNC's running KISS, and four local terminals with no great headache... processing and I/O horsepower is about equivelent of a fast 286 clone...

>Out here in the real world, where people use packet to communicate, they
>don't give a fuzzy rat's posterior about software experimentation; they
>just want to send packets back and forth.

Some of us understand this. The goal isn't to make everyone a packet experimenter (though I don't personally think that would be bad :-), but instead to experiment so that we can provide the larger user base better ways to "send packets back and forth". The fragile nature of BBS forwarding links running across NET/ROM paths here in CO is interesting to watch in side-by-side comparison with mail forwarding using SMTP/TCP/IP over the same paths... passing mail direct to Los Alamos from Colorado Springs through a long string of single-port NR nodes using NET really works, because of the

stability of TCP under adverse link conditions, where the local PBBS sysops get frustrated because they "can't keep a link going long enough to pass traffic". Real, empirical evidence that we're moving in the right direction.

You need to do the following to get from sources to working bits on Unix or
lookalike systems:

     edit the file config.h, this specifies what drivers you want, some
     of which won't make sense for your configuration.

     run 'make depend' to update the depend.out file for the weirdies
     in include files on your system.

     run 'make' to build net.debug and a stripped net

 I experienced similar problems trying NET on a 3B1 connected to
a Sun at 9600 baud (complete incapacity to do anything else). It
turns out that the original version of the "sys5_io" routine didn't
do any buffering. As a result, NET was making single character
read calls to the kernel. I hacked the version I had at the
time (871225.1) to buffer up to 512 bytes and saw a LARGE
improvement in efficiency. I am pretty sure this is the
largest single difference between NET and "uucico". The
version of NET just released (890421.1) includes a buffering
mechanism which seems to work very well. I have been testing it

at 19200 to a Sun and find that I can actually get other things
done even with an incoming transfer in progress. (I have
also played games with the output queue high water mark and
the input queue flush mark (NTTYHOG).)

To: All

Ladies & Gentlemen-

       I see that news of John Wiseman's implementation of NET/ROM for the
pc environment has started to find its way into this country. This unique
piece of software has some real benefits for BBS sysops and deserves a
close look by everyone.

       John G8BPQ has called his program TheNode, and that is how it is
known in the UK. It is bundled together with every DRSI PC*Packet Adapter
we deliver, renamed as PC/Node to avoid any association with NORDLINK or
TheNet.

       For anyone considering this as an alternative to NET/ROM, please
take note and spread around that G8BPQ's implementation is a completely

independent implementation of NET/ROM. John worked from the published Software 2000 specification, worked with a different compiler and has produced a new program which is compatible, but with new and valuable features. DRSI has provided Ron Raikes WA8DED with copies of G8BPQ's code for his examination. Ron has said that it appears to be a totally independent creation. Both Ron and John have separately told me that they have never met or spoken with each other. Anyone can use this code with the best assurances that it is exactly what is presented- a compatible alternative to NET/ROM.

PC/Node works this way - It provides both a NET/ROM-compatible driver and a BBS-support interface in the form of a Terminate-and-Stay-Resident program. When used with the PC*Packet Adapter, PC/Node turns the adapter into a dual-port node. It will broadcast its identity into the surrounding network and will accept other nodes into its own tables. It looks just like a NET/ROM node.

PC/NODE also has support for both the W0RLI and WA7MBL bulletin boards. The same TSR presents a "virtual COM: port" within standard DOS. The sysop declares a set of these com: ports in the configuration file. For example, he might declare COM10:,COM11: and COM12:. These three ports do not exist in hardware, but any MBBIOS-compatible application can open them and "talk" to the node. John has provided a subset of the standard commands at this interface, enough to be able to run either BBS. If the host system has enough memory, several copies of these BBS's can be run in separate windows. We see no reason why both W0RLI and WA7MBL could not be run simultaneously in the same system.

Roy Engehausen AA4RE is working with G8BPQ to assist John in adding the WA8DED Host Mode interface to PC/Node. This will permit Roy's multi-connect bbs to run with PC/Node.

To the user, PC/Node looks just like a NET/ROM node which happens to have a BBS located on-site. He connects to the node, then types either a connect command to the BBS with its callsign (i.e. "C W4BBS") or simply types "C BBS". Either command causes the node to immediately connect the user to any available "virtual COM: port". He is immediately on the board. If he is a true local, the user can skip connecting to the node, and can connect directly to the BBS by using its callsign.

The sysop can configure PC/Node to provide either the NET/ROM service, the BBS service or both. All configuration is done through a text file.

OTHER POSSIBILITIES ==========

Much has been said about the limitations of NET/ROM running in the 32K memory space of a TNC-2. There just isn't any room for additional code to do any meaningful work. PC/Node provides a way for programmers and hackers to add new, interesting and valuable functions to their systems.

While the COM: port has been presented as BBS facility, it can be also used to interface to any program which talks to an MBBIOS port. This

immediately opens the door for everyone who wants additional functionality. Simply write a "server" to perform any function your imagination can conjure up.

The professional PC magazines are filled with the "new" client-server programming model which is being promoted in the Local Area Network world. This programming approach divides an application into two parts, one running on the user's system and the other running on the database server.

If you want additional functionality, write a program which opens and waits for a ***CONNECTED on the com: ports. With all the A/D, D/A, control and sense boards on the market, a simple program can control lights, power, accessories, antennas, security, make coffee, ... It's limited only by your imagination.

DEMONSTRATION at the NATIONAL CONVENTION
==

DRSI will be demontrating PC/Node on the air at Ham-Com 89, coming up on the first weekend in June at the Arlington Convention Center, Arlington, Texas. Our booth are numbers 11 and 12, and will be right across from the Texas Packet Radio Society. (TPRS will be demonstrating TEXNET, another fine alternative network package.) PC/Node diskettes will be available, for those who want to use this program with KISS-equipped TNC's.

What's legal, and what the band plan is, are two different things.
If you violate the band plan but do not cause interference (or violate any
other rules) then you are LEGAL, a LID maybe, but LEGAL.

>   Have you considered cross-band repeats? That would REALLY simplify the
>   duplexer, like in almost none.
>
> And the really great part is everyone would need 2 radios (or one dual
> band) to dedicate to packet... :-)

Or, you could only talk to people on the Other band if the repeater is
reversable.

What if all the repeaters talked to everyone on 145.01 and talked to each
other on 223.40? As long as you could reach TWO machines, you are in. Of
course that also requires the repeaters be addressable, which I have not yet
seen an implementation that can do this and repeat live (something I have been
wanting to do).

Version V0.91 of the multiuser mailbox UFQBBS is available with
anonymous ftp on the Internet from tomcat.gsfc.nasa.gov.
The files are in the bbs/ufqbbs directory. Unfortunately the files
have been archived with a program called ZIP. I cannot run ZIP on this
UNIX machine so I have not been able to check the files. I have
uploaded the ZIP program as well, so any user with a PC should not have
troubles with extracting the files.

The files on tomcat happened to be uploaded on April 1st. This is
purely unintentional...

The BBS provides a NET/ROM lookalike interface called "The Node".
You can connect to it and it will work just like a normal NET/ROM node but
there is one extra command, "BBS", that connects you to the BBS.

The software works with any TNC that supports KISS mode.

Here follows a release note received on packet.
Please send any questions to the author, G4GOU, and not to me.

Good luck, Anders SM0RGV

Msg MID:CC3A6F0D
Hi,
The latest version of the UFQBBS (0.91) is now ready and can be
downloaded from my phone bbs on 0522-511277 (Net 2:258/46)
This code is much improved, and fixes most of the bugs in previous versions.
It is fully multi-user, and will support several tnc's with multi-connect
on each running in a single 170k Desqview window. (The distributed version
is limited to two tnc's with 9 simultaneous connects on each)
It is fully compatible with version 3.01 of THE NODE. It also allows for
forwarding to occur simultaneously to several stations.
In addition to the usual BBS commands (very similar to MBL & RLI) it
also supports gateway connects and a conference facility whereby several
users can chat to one another - something which is difficult to do with
a normal packet qso.
File Upload/download is not yet implimented, but should be ready soon.
For more information contact me at this bbs or QTHR.
73 Mike G4GOU sysop GB7LNX & GB7LX

SUBJECT: World Wide Packet Radio Listing

Again, I have received a message telling me that my Stats for the USA and Foreign countries are incorrect. AGAIN I WILL TELL YOU THAT YOU ARE RIGHT. As long as YOU do not send me updates I can not correct the problem you tell me about. This is just like a doctor telling you that your are SICK but NOT telling you how to solve the problem. As long as you my fellow hams do not give me the information then IT WILL BE INCORRECT. I have received messages from Europe telling me that there are more digipeaters and PBBS in a certain country, but they will not tell me what to change or what to add or what to delete. I dont mind people telling me that the data is incorrect, but I do mind when they will not give me the answers to correct the problem. How does anyone expect me to keep this list current if they wont give me the information. I have had to beg, scream, plead, etc. to get this information. Well, if the HAM community does not want to help then I will be glad to discontinue the database of Digipeaters and PBBS. It would be a shame, because there is a lot of usefully information in it that the BBS Operators use, in addition a lot of BBS Users and NTS Operators are using it so that they can forward mail directly to certain BBSs. So what about it people, Lets see those changes, deleteions, additions, and confirmations come in. Make me work late at night to keep the list up to date.

If you want to help please provide the following information for each and every Digipeater and PBBS in your area or areas that you know about.

1. Call Sign 2. SSID
3. City 4. State/Provence
5. Country 6. ZIP/Postal Code
7. MAP Grid 8. Frequency
9. Type Activity (Digi or PBBS) 9. Activity Code(s) (See below)

Activity Code - A - DIGI - TNC-1 or Clone (Dumb Digipeater)
B - DIGI - TNC-2 or Clone (Dumb Digipeater)
C - DIGI - Layer 3/4 Node (Network Node)
D - DIGI - VC Switch (COSI)
E - DIGI - TEXNET

F - DIGI - TCP Switch
G - DIGI - TCP Gateway
H - DIGI - KANODE (Without Gateway)
I - DIGI - KANODE (With Gateway)
J - DIGI - 9600 Baud TNC
K - DIGI - 56 KB TNC
L - DIGI - Packet Radio Repeater
M - DIGI - Converse TNC
- DIGI - This is a Backbone Frequency and users
are requested not to use it.
1 - PBBS - BBS, Local User access and Mail Forwarding
2 - PBBS - BBS, Forwarding ONLY (No Users)
3 - PBBS - BBS, Local User access and No Mail Forwding
4 - MBOX - Personnel Mailbox (NOT PBBS) that PBBS can
forward to.

Please let me know of any corrections, deletions, additions or verifications to this file. Send them to me - K4NGC @ K4NGC via one of the Packet Radio PBBS mailboxes. Any call signs listed on this list will be purged if the update date exceeds 2 years, therefor verification is necessary.

Ham Radio On Space Shuttle!

Date: 1 Apr 89 03:07:02 GMT
From: att!homxb!hotps!ka2qhd!kd2bd@ucbvax.Berkeley.EDU (John Magliacane Wall
Township NJ)
Subject: Ham Radio On Space Shuttle!

ARRL BULLETIN 14 ARLB014
FROM ARRL HEADQUARTERS
NEWINGTON CT MARCH 27 1989
TO ALL RADIO AMATEURS

AN AMATEUR RADIO STATION IS SCHEDULED TO FLY ABOARD THE SPACE SHUTTLE
IN MARCH 1990. APPROVAL FOR THE INCLUSION OF THE SPACE SHUTTLE
AMATEUR RADIO EXPERIMENT CALLED SAREX ON THE SECONDARY PAYLOAD LIST
OF FLIGHT STS 35 HAS BEEN RECEIVED FROM NATIONAL AERONAUTICS AND
SPACE ADMINISTRATION HEADQUARTERS. RON PARISE, WA4SIR, A PAYLOAD
SPECIALIST FOR THE ASTRO 1 PAYLOAD TO BE CARRIED ON THAT FLIGHT WILL
OPERATE THE STATION IN THE ORBITING SHUTTLE. REPRESENTATIVES OF ARRL
AND SAREX, COSPONSORS, THE RADIO AMATEUR SATELLITE CORPORATION,
AMSAT, STATED THAT THEY LEARNED OF THE APPROVAL AT A MEETING WITH
NASA OFFICIALS HELD ON MARCH 14 AT THE LYNDON B JOHNSON SPACE
CENTER IN HOUSTON.

WA4SIR WILL COMMUNICATE WITH AMATEUR OPERATORS WORLDWIDE USING VOICE
AND VIDEO COMMUNICATIONS AS WELL AS PACKET RADIO. THE ORBIT OF THE
SHUTTLE WILL ALLOW AMATEURS LOCATED BETWEEN APPROXIMATELY 46 DEGREES
NORTH AND 46 DEGREES SOUTH LATITUDES TO COMMUNICATE DIRECTLY WITH THE
SHUTTLE. THE SAREX TRANSMISSIONS FROM THE SPACE SHUTTLE WILL BE SUCH
THAT A STANDARD SCANNER RADIO CAN RECEIVE THEM.

THE APPROVAL FOR SAREX OPERATION IS CONTINGENT ON FINAL APPROVAL BY
JOHNSON SPACE CENTER OF THE SAREX HARDWARE AND OPERATIONS PLAN AND ON

PRIORITIZATION OF SECONDARY PAYLOADS FOR THE STS 35 FLIGHT.

For some time, I've been getting mail of the form "I want a copy of your
code but I can't FTP from here". Lately these requests have reached a fever
pitch.

It has gotten to the point where I simply have no choice but to put my foot
down and say that I can't honor any more such requests. Figuring out how to
get a large binary file to somebody through a jury-rigged chain of UUCP
sites and/or FOOBARNET mail gateways is extremely time-consuming and tedious.
I'm sure people would rather have me spend my time coding!

Furthermore, shipping large files like the KA9Q TCP/IP sources through the
mail gateways that do exist to other networks is, in my opinion, abusing the
hospitality of the gateway operators. In most (if not all) cases, these
paths use dialup phone links, with the gateway operators footing their own
phone bills in order to provide a courtesy to others.

If you cannot access the anonymous FTP directories on flash.bellcore.com or louie.udel.edu, I suggest the following alternative ways to obtain the code:

1. If you are at a university, commercial or governmental institution that has an internal computer network, jump up and down until you convince your management that you should join the Internet. With the development of the NSFNET backbone and the regional networks, Internet connectivity is now available to almost any organization doing research or development, not just those with DoD contracts. The Internet is so incredibly useful for so many things that it is becoming at least as essential as telephone service for an awful lot of people.

2. If you cannot get on the Internet, find a friend who *is* on the net and get them to fetch the code for you. I encourage people to set up informal "networks" to distribute copies of my code to their friends, as long as the use is non-commercial. You may ship disks around, use bulletin boards or do direct phone or packet radio transfers; your choice. I strongly encourage those with Internet access to make current copies of the code available to others, e.g., by public access UUCP a la N3EUA's or WB3FFV's UNIX systems. Given the time it takes to send the stuff even at 2400 baud, I'm sure these two systems could use some help in sharing the load.

3. If all else fails, wait until the new releases are announced as being available through the TAPR office on floppy. You will have to wait a while, as TAPR prefers to deal only with "official" releases, not the "snapshots" of development code I've been regularly putting out for testing.

The only exception I will make to my rule of staying out of the code distribution business is for people who have already proven themselves as contributors to the coding effort. For these relatively few people I am willing to prepare and mail floppies when necessary, but because of the time and expense I am simply unable to do this for everyone who asks.

Thanks for your understanding.

Phil Karn, KA9Q

I tried this one some weeks ago, but haven't yet received any answers
so I try again.

LA4BM is the only one in this LAN running the HAPN-card. Therefore
we don't know if there is a problem with his card or if it is a
common problem.

The problem is; Every time the card detects traffic on the channel
it keys the transmitter for some milliseconds (or so). It behaves
normal if the traffic is meant for him, but as soon as there
is traffic meant for someone else it starts acting this way.
This makes of course trouble for the other users since almost
all response-packets (ACK, NAK etc) is doubled with this keying.

Is there any reasonable solution to the problem?? I will be
very pleased to hear from any HAPN-user (or anyone else with
an opinion).

Please mail responses to me directly as well as to the net.

PACKET-RADIO Digest   Mon, 3 Apr 89   Volume 89 : Issue 87

Today's Topics:
                     4SALE items on BBS is legal.
                        UFQBBS V0.91 available

Date: 1 Apr 89 21:40:31 GMT
From: portal!cup.portal.com!Ed_Eric_Mitchell@uunet.uu.net
Subject: 4SALE items on BBS is legal.

4 SALE IS LEGAL.

The following quote comes from the The FCC Rule Book, page 6-9, published by the American Radio Relay League, and is followed by an additional written policy statement from the FCC:

Q. In the United States there are many nets that cater to hams selling and buying their ham radio equipment. Are these so-called 'swap and shop' nets legal?

A. Yes, within certain constraints. Amateurs may use their stations from time to time to discuss the availability of a piece of Amateur Radio equipment, but such activity would be limited to that of an occassional nature. It's best not to discuss price on the air. Instead, swap phone numbers with the interested party and finish the dickering off the air. Activities could not include any items of a personal nature, such as a camera or ordinary broadcast radios. Hams should not engage in regular 'flea market' or business activities on swap nets so as to derive a profit by buying and selling ham gear on a regularly scheduled basis (97.112).

END OF QUOTE FROM ARRL PUBLICATION

Direct quote from FCC PR Docket 88-139, page 5 (i.e. this is a policy statement direct from the Federal Communications Commission):

36. Current policy permits amateur stations to transmit information about the availability of amateur radio equipment, notwithstanding Section 97.110, 47 C.F.R. Section 97.110, prohibiting business communications. In this context, amateur radio equipment is equipment normally used in an amateur station by an amateur operator. An asking price may be mentioned, but no subsequent negotiations or bartering may take place. If interest is expressed, the amateur operators should exchange mailing addresses or telephone numbers and finish negotiations using means of communication other than amateur service frequencies. Delaers may not take advantage of this exception. Amateur operators who derive a profit by buying and selling amateur radio equipment on a regular basis are considered dealers and violate the business prohibition if they use amateur service frequencies for this purpose. Proposed Section 97.219(c) codifies these policies.

END OF FCC QUOTE

Clearly, under written policy statements from both the ARRL, and the FCC, in 1988, the posting of 4 sale items concerning Amateur Radio equipment is completely and unequivocably legal, including, as stated above, the posting of an asking price. Note also that the FCC interpretation is slightly more liberal than the ARRL interpretation.

While Section 97.219(c) is a part of the proposed rules rewrite, the FCC has made it explicitly clear in this section of the NPRM that the FCC's own interpretation of the existing Part 97 is that the posting of 4 SALE items, including an asking price is legal.

I urge all SYSOPS to adhere to the this FOR SALE policy. There is no need to censor messages that fall within the above described categories.

signed,
Ed Mitchell

From: mcvax!kth!osiris!sics.se!klemets@uunet.uu.net (Anders Klemets)
Subject: UFQBBS V0.91 available

Version V0.91 of the multiuser mailbox UFQBBS is available with anonymous ftp on the Internet from tomcat.gsfc.nasa.gov.
The files are in the bbs/ufqbbs directory. Unfortunately the files have been archived with a program called ZIP. I cannot run ZIP on this UNIX machine so I have not been able to check the files. I have uploaded the ZIP program as well, so any user with a PC should not have troubles with extracting the files.

The files on tomcat happened to be uploaded on April 1st. This is purely unintentional...

The BBS provides a NET/ROM lookalike interface called "The Node".
You can connect to it and it will work just like a normal NET/ROM node but there is one extra command, "BBS", that connects you to the BBS.

The software works with any TNC that supports KISS mode.

Here follows a release note received on packet.
Please send any questions to the author, G4GOU, and not to me.

Good luck, Anders SM0RGV

To :UFQBBS@EU
From:G4GOU @GB7LNX.GBR.EU
Msg MID:CC3A6F0D
Hi,
The latest version of the UFQBBS (0.91) is now ready and can be downloaded from my phone bbs on 0522-511277 (Net 2:258/46)
This code is much improved, and fixes most of the bugs in previous versions.
It is fully multi-user, and will support several tnc's with multi-connect

on each running in a single 170k Desqview window. (The distributed version
is limited to two tnc's with 9 simultaneous connects on each)
It is fully compatible with version 3.01 of THE NODE. It also allows for
forwarding to occur simultaneously to several stations.
In addition to the usual BBS commands (very similar to MBL & RLI) it
also supports gateway connects and a conference facility whereby several
users can chat to one another - something which is difficult to do with
a normal packet qso.
File Upload/download is not yet implimented, but should be ready soon.
For more information contact me at this bbs or QTHR.
73 Mike G4GOU sysop GB7LNX & GB7LX

HAPN-problems
HELP! HELP!

Date: 4 Apr 89 10:18 +0100
From: Magne Maehre <m_maehre%avh.unit.uninett%NORUNIX.BITNET@CUNYVM.CUNY.EDU>
Subject: HAPN-problems

I tried this one some weeks ago, but haven't yet received any answers
so I try again.

LA4BM is the only one in this LAN running the HAPN-card. Therefore
we don't know if there is a problem with his card or if it is a
common problem.

The problem is; Every time the card detects traffic on the channel
it keys the transmitter for some milliseconds (or so). It behaves
normal if the traffic is meant for him, but as soon as there
is traffic meant for someone else it starts acting this way.
This makes of course trouble for the other users since almost
all response-packets (ACK, NAK etc) is doubled with this keying.

Is there any reasonable solution to the problem?? I will be
very pleased to hear from any HAPN-user (or anyone else with
an opinion).

Please mail responses to me directly as well as to the net.

Vy 73 de Magne LA1BFA

SUBJECT: World Wide Packet Radio Listing

Again, I have received a message telling me that my Stats for the USA and Foreign countries are incorrect. AGAIN I WILL TELL YOU THAT YOU ARE RIGHT. As long as YOU do not send me updates I can not correct the problem you tell me about. This is just like a doctor telling you that your are SICK but NOT telling you how to solve the problem. As long as you my fellow hams do not give me the information then IT WILL BE INCORRECT. I have received messages from Europe telling me that there are more digipeaters and PBBS in a certain country, but they will not tell me what to change or what to add or what to delete. I dont mind people telling me that the data is incorrect, but I do mind when they will not give me the answers to correct the problem. How does anyone expect me to keep this list current if they wont give me the information. I have had to beg, scream, plead, etc. to get this information. Well, if the HAM community does not want to help then I will be glad to discontinue the database of Digipeaters and PBBS. It would be a shame, because there is a lot of usefully information in it that the BBS Operators use, in addition a lot of BBS Users and NTS Operators are using it so that they can forward mail directly to certain BBSs. So what about it people, Lets see those changes, deleteions, additions, and confirmations come in. Make me work late at night to keep the list up to date.

If you want to help please provide the following information for each and every Digipeater and PBBS in your area or areas that you know about.

1. Call Sign 2. SSID
3. City 4. State/Provence
5. Country 6. ZIP/Postal Code
7. MAP Grid 8. Frequency
9. Type Activity (Digi or PBBS) 9. Activity Code(s) (See below)

Activity Code - A - DIGI - TNC-1 or Clone (Dumb Digipeater)
B - DIGI - TNC-2 or Clone (Dumb Digipeater)
C - DIGI - Layer 3/4 Node (Network Node)
D - DIGI - VC Switch (COSI)
E - DIGI - TEXNET
F - DIGI - TCP Switch
G - DIGI - TCP Gateway
H - DIGI - KANODE (Without Gateway)
I - DIGI - KANODE (With Gateway)
J - DIGI - 9600 Baud TNC
K - DIGI - 56 KB TNC
L - DIGI - Packet Radio Repeater
M - DIGI - Converse TNC
- DIGI - This is a Backbone Frequency and users are requested not to use it.
1 - PBBS - BBS, Local User access and Mail Forwarding
2 - PBBS - BBS, Forwarding ONLY (No Users)
3 - PBBS - BBS, Local User access and No Mail Forwding
4 - MBOX - Personnel Mailbox (NOT PBBS) that PBBS can forward to.

Please let me know of any corrections, deletions, additions or verifications to this file. Send them to me - K4NGC @ K4NGC via one of the

Packet Radio PBBS mailboxes. Any call signs listed on this list will be purged if the update date exceeds 2 years, therefor verification is necessary.

Gateway: The ARRL Packet Radio Newsletter

Stan Horzepa, WA1LOU, Editor - Sal Prado, Gateway Circulation

Volume 5, Number 13 March 17, 1989

ROSE SWITCH ON

The long awaited ROSE (RATS Open Systems Environment) X.25 Packet Switch software has been released by The Radio Amateur Telecommunications Society (RATS). This release of the ROSE Switch software runs in a TNC 2 (or clone) or in a PacComm DR-200 two-port controller. TNC 2s may also be operated in a "back-to-back" configuration. The software was written by Tom Moulton, W2VY, and is free, for Amateur Radio use only. It may be obtained by downloading it from CompuServe's HamNet (filename: ROSESW.ARC).

from J. Gordon Beattie, Jr, N2DSY via CompuServe's HamNet

TAPR FOCUSES ON ON-GOING PROJECTS AT ANNUAL MEETING

The board and members of Tucson Amateur Packet Radio (TAPR) met on February 24-26 in Tuscon, Arizona, to discuss activities of the past and forthcoming year. Heavy TAPR support, both financial and technical, for AMSAT's MicroSat project has been the major activity of the past year, followed closely by the digital signal processing (DSP) project (see Gateway, Volume 4, Numbers 4, 8 and 12 and Volume 5, Number 10). While the MicroSat project should be winding down after launch in a few months, the DSP project should "ramp up" toward production of DSP units.

Other TAPR projects discussed at the meeting included modem upgrade retrofits for the TNC 2 and an upgrade to the TNC 1 to allow it to run TNC 2 firmware (see Gateway, Volume 5, Number 9).

Numerous talks were given, including updates on TexNet, TCP/IP, MicroSat, DSP and the HF message-forwarding network. Technical talks introduced a prototype IBM PC plug-in compatible intelligent packet-radio controller by Mike Chepponis, K3MC; a DSP-based analysis by Dan Morrison, KV7B, of filter-type vs phase-locked loop FSK demodulators; and prototype 1.2-GHz transverters designed by Glenn Elmore, N6GN, for use with WA4DSY 56-kbit/s modems.

The theme of the weekend, or, at least, the most discussed subject, was TAPR's support for some type of new Amateur Radio license class that does not require a knowledge of Morse code. The TAPR board of directors, which met on the 24th and 25th, appointed Harold Price, NK6K, to oversee the generation of a specific proposal by TAPR. That proposal is to be forwarded to the ARRL No-Code Study Committee.

Newly elected TAPR board of directors were announced:

Franklin Antonio, N6NKF;
Bdale Garbee, N3EUA;
Steve Goode, K9NG;
Eric Gustafson, N7CL;
Lyle Johnson, WA7GXD.

by Jon Bloom, KE3Z

CALL FOR PAPERS: ARRL COMPUTER NETWORKING CONFERENCE

The eighth ARRL Amateur Radio Computer Networking Conference will be held on Saturday, October 7, 1989, at the Air Force Academy in Colorado Springs, Colorado. Technical papers are invited on all aspects of Amateur Radio digital communications via ionospheric, tropospheric, meteor-scatter and satellite modes. Topics may include network development, architecture, protocols, standards, hardware, software, modulation and encoding schemes, applications, frequency planning and practical experience, such as traffic handling. Of particular interest are digital signal processing, digital speech and image transmission, and new space programs employing digital communications.

Prospective contributors should request an author's kit and identify the topic of their paper immediately. The deadline for receipt of camera-ready manuscripts is August 28, 1989. Author kit requests and camera-ready manuscripts should be mailed to Lori Weinberg at ARRL headquarters.

Printed proceedings will be available at the conference and by mail from ARRL headquarters.

PACKET RADIO IN WEST GERMANY

In the following exclusive Gateway report, Ekki Plicht, DF4OR, the official in charge of visual communications for Deutscher Amateur Radio Club (DARC), describes the state of the art of amateur packet radio in the Federal Republic of Germany, where it is one of the fastest growing, if not the fastest growing, Amateur radio mode.

In the Beginning...

Packet radio in DL-land started on one 2-meter frequency, 144.675 MHz. While some enthusiasts enjoyed a quiet frequency and made connections through the whole country, even DX contacts into France, Switzerland and Austria, the growing interest in this new form of communications made efficient "normal" digipeating impossible, due to the increase in the number of collisions. So, in those early years, DARC started to develop a plan which would offer reliability and promise for future years. This plan stated that

o On 2 meters there are too few frequencies for packet radio (exactly three

for digital communications);

- Therefore, user input frequencies should be placed on 70 cm and higher;

- Internode communications should take place on 23 cm and higher and the link between two nodes should be exclusive and realized with directional antennas and the lowest power possible.

This scheme developed well, although some people still favor 2-meter operation due to availability of less expensive equipment.

To understand the situation in West Germany, let me explain some of the more important differences between West Germany and US. The 2- meter band is much smaller than in the US (only 2 MHz, from 144.000 to 146.000 MHz). Digital communications occur from 144.625 to 144.675 and 145.300 MHz. This is not enough for a network, since there are still other digital activities besides packet radio, such as RTTY, FAX, etc.

On the average, West Germany is more densely inhabited than the US, thus, a digipeater has to serve a greater number of users. To avoid collisions between digipeaters serving different areas on the same frequency, they should not be located at good DX sites. Therefore, it is necessary to install a large number of medium-range digipeaters in order to build a nationwide network. This is possible only on 70 cm, where enough room is available (10 MHz, 430.000 to 440.000 MHz). (There is no 220-MHz band in Region 1, and 6-meter operation is not allowed in West Germany.)

The Situation Today

In early 1989, 74 digipeaters and 24 PBBSs are active in West Germany. Three digipeaters are still on 2 meters, the so called "NORD><LINK experiment." These are some of the earliest digipeaters in West Germany which were set up to learn about utilization of the 2-meter band for packet radio. Except for one station on 23 cm (a user input), all of the other stations are on 70 cm. The subbands used on 70 cm are:

- 433.625-433.775 MHz: simplex, digipeater, station-to-station

- 438.025-438.175 MHz: simplex, PBBS, digipeater, station-to-station

- 438.200-438.525 MHz: duplex output, 7.6-MHz shift, digipeater (not yet in use)

Duplex digipeaters are preferred for their improved throughput and collision avoidance, even though they consume twice the space. Besides, they are a perfect way to defend our endangered 70-cm band. (For a fair presentation of the situation here, it must be said that ATV operators are not happy with the frequency allocations in the upper part of the 70-cm band.)

All nodes use 1200-bit/s modems on the user frequencies with one experimental station near Bonn using 4800-bit/s. Most digipeaters are connected to some other node via 23-cm links. There are still some links

on 70 cm, but they will be moved to 23 cm or higher when possible. The 23-cm links are on exclusive duplex frequencies, so collisions should be minimal.

The necessity of using 23 cm for internode communication led to some interesting developments in UHF equipment. To name one, there is a reasonably-priced, one-watt transceiver kit developed by DF9IC and DL5UY from Karlsruhe, that is capable of 1200-bit/s, half-duplex operation. It is ready to connect to a 1200-bit/s AFSK modem and covers the 23-cm band from 1240 to 1300 MHz.

Many experiments are taking place on higher frequencies. For example, in the Munich area (Bavaria), some experiments are in progress using the 6-cm and 10-GHz bands.

PACKET RADIO IN WEST GERMANY - (Part 2)

Modem Hardware

Besides the standard 1200 bit/s modems using TCM3105, AMD7911 and XR2211 chips, there are other modem developments. DJ4ZC of AMSAT-DL has developed the "RSM-Modem" which uses rectangular spectrum modulation. It is capable of 9600 bit/s full-duplex operation and is under test on two digipeaters. NORD><LINK's DK4EG has developed a 4800-bit/s modem. Elsewhere, tests are being conducted with G3RUH's 9600-bit/s modems.

Digital Hardware...on Hilltops

About 50% of the digipeaters in West Germany use standard TNCs including many compatible clones of the well-known TNC 2. Most, if not all, use NET/ROM or TheNet.

Another large number of digipeaters use the so-called "RMNC" (Rhein-Main-Network Controller) which was developed by DH1FAB and others in Frankfurt. It uses the 6809 microprocessor and is contained on one printed circuit board that includes the CPU, 32-kbyte of RAM, 32-kbyte of ROM, SCC, VIA and a TCM3105 modem. It is available at a reasonable price.

A few digipeaters use homebuilt hardware or software. For example, the HP9000-series computers with homebuilt slot modems used in the Stuttgart area running UNIX, another 6809 system running FLEX, etc.

A large number of hams use the Commodore C-64 for packet-radio operation running DIGICOM>64 Version 2 software and an inexpensive user-port modem. Another large chunk of the packet-radio population use TNCs, PK-232s, KAMs or similiar controllers.

Digital Hardware To Come

Rumors concerning recent new hardware developments include a larger CPU for the RMNC by DG8FAC and another board for the RMNC using the H16-series computers by DK7WJ.

Software...on Hilltops

Nearly all of the TNC-equipped digipeaters use NET/ROM or TheNet. Plans are to further improve TheNet as far as code-space considerations will allow. The latest development for TNCs is a converse-mode EPROM from DL8ZAW which is linked to a NET/ROM node via the EIA RS-232-C interface.

Software that is available for the RMNC (RMNC V1.6) includes a simple tool that uses an unchanging routing table in EPROM with no hop-to-hop acknowledgement or connectability.

Another software design is DK7WJ's FLEXNET. It has a lot of capabilities including hop-to-hop acknowledgment (without changing the SSIDs), an information system, MHeard list, converse mode and more. Currently, it is used on one digipeater equipped with professional hardware (6809 multiprocessor), but it will be ported to the low-cost RMNC, resulting in the Version 2 of the RMNC software (whenever I finish the low-level I/O).

In Karlsruhe, DL5UY/N1EOV and DJ0VL developed their own software running on an 68000 OS-9 system, incorporating a PBBS, standard digipeating and TCP/IP facilities based on KA9Q's software.

DK5SG developed another program under UNIX, running on a HP9000 series computer, which includes a PBBS, autorouter and, again, TCP/IP based on Phil's code. This is the so-called "WAMPES" (Wuertemberg Amateur Packet Experimental System). It is currently used by four or five stations in the Stuttgart area. WAMPES now has an extension which makes it compatible to NET/ROM-like internode communications (Layer 3/Layer 4 protocols). FLEXNET (and, by that, the RMNC) will follow by the summer of this year. Thus, we hope to get a consistent network all over the country.

The DARC department for visual communications will try to bring the major software developers of central Europe together for a conference where standardization and extension of the Layer 3/Layer 4 protocol will be discussed.

Software at Home

Many hams use the famous DIGICOM>64 software for the Commodore C-64/C- 128 computers written by DL8MBT. Its capabilities and user interface is nearly unbeaten by any other software. It is also used in the US as well.

People who use TNCs are running TAPR (V1.1.4) or WA8DED (V2.1) firmware. The latter software has been rebuilt by the NORD><LINK group and is available under the name "TheFirmware." It has some nice improvements (clock, MHeard, KISS-mode) and is mostly used as host- mode software.

There are some host-mode programs for the IBM PC, for example, TURBO HOST by DL1BHO, PCT by DD6CV, and CTERM by DD5KZ. All of these use windowing, file I/O and enhance the TNC with many features. For the PK-232, there is PC-PAKRATT.

Most of the mentioned software and firmware is public domain. There is a little TCP/IP operation in West Germany, mainly in regions where a TCP/IP PBBS or digipeater is reachable. (One digipeater in West Germany is running KA9Q TCP/IP code.) Nevertheless, several hams have improved the KA9Q program with windowing (DK3SI) and other features (DK8GD).

PACKET RADIO IN WEST GERMANY - (Part 3)

PBBS Software

Until about a year and half ago, the WA7MBL PBBS software was used throughout Germany. But, then DF3AV, from the NORD><LINK group developed PBBS software called "DIEBOX" or "TheBox." Its greatest advantage is its multiuser capability that can handle up to eight users per TNC. This was badly needed for the crowded PBBSs serving hundreds of users in various regions of West Germany. Its store-and- forward scheme is compatible with the WA7MBL/W0RLI standard. The user interface uses a completely different approach than the WA7MBL PBBS. Another feature is its "lifetimer" which keeps the amount of information to a reasonable size. The average throughput of some mailboxes is approximately 75 Mbytes per month.

PBBSs running under UNIX or OS-9 (DK5SG and DL5UY) use improved WA7MBL software.

Packet Radio on HF

On HF, one mailbox is in operation: DK0MWX on 14.099 MHz. Most of our international traffic is handled through this mailbox, but, because of some legal uncertainty with third-party traffic, no direct contact is made between West Germany and US. We hope that will change in the future.

Many private stations are on 20 meters and should be operating below 14.099 MHz. The latest IARU Region 1 HF conference, held in late 1988, announced that a 100-kHz subband on 10 meters is allocated for narrow-band FM packet radio. This is from 29.200 to 29.300 kHz with 29.250 MHz as the center of activity.

Other Activities

A regular packet-radio conference is held in Frankfurt once a year. This meeting was attended by approximately 150 people last year, mainly PBBS SYSOPs and hardware/software developers. A beginners' conference was also held in Frankfurt in 1987 and should be repeated this year.

A software conference with a small circle of "gurus" is badly needed to catch up with the fast development of new software everywhere. It should ensure compatibility with all of the new programs without stopping anyone from writing new software or reinventing the wheel for the n+1 time.

The Future

We are far from having nationwide coverage by a packet-radio network, but

the path seems clear. The number of new licenses for digipeaters has decreased a little, but some regions have not yet come on-line.

What we need now is to improve internode communications by means of hardware and software. The expected interest in packet radio indicates that the 1200-bit/s links are not fast enough. Roughly, about 10% (5000-plus hams) are QRV on packet radio and the number is still growing.

Again, to give a complete picture of the situation in West Germany, it must be said that not everyone is content with the concept that DARC has for packet radio. Also, there are people who think that packet radio has nothing to do with good ol' ham radio at all and should be abandoned altogether. Admittedly, packet radio is not everything the beautiful hobby of ham radio can give us, but for many people it is one of the most fascinating parts of it. And, if we keep on talking with each other, there should be room for us all.

Volume 5, Number 13 March 17, 1989

ROSE SWITCH ON

The long awaited ROSE (RATS Open Systems Environment) X.25 Packet Switch software has been released by The Radio Amateur Telecommunications Society (RATS). This release of the ROSE Switch software runs in a TNC 2 (or clone) or in a PacComm DR-200 two-port controller. TNC 2s may also be operated in a "back-to-back" configuration. The software was written by Tom Moulton, W2VY, and is free, for Amateur Radio use only. It may be obtained by downloading it from CompuServe's HamNet (filename: ROSESW.ARC).

from J. Gordon Beattie, Jr, N2DSY via CompuServe's HamNet

TAPR FOCUSES ON ON-GOING PROJECTS AT ANNUAL MEETING

The board and members of Tucson Amateur Packet Radio (TAPR) met on February 24-26 in Tuscon, Arizona, to discuss activities of the past and forthcoming year. Heavy TAPR support, both financial and technical, for AMSAT's MicroSat project has been the major activity of the past year, followed closely by the digital signal processing (DSP) project (see Gateway, Volume 4, Numbers 4, 8 and 12 and Volume 5, Number 10). While the MicroSat project should be winding down after launch in a few months, the DSP project should "ramp up" toward production of DSP units.

Other TAPR projects discussed at the meeting included modem upgrade retrofits for the TNC 2 and an upgrade to the TNC 1 to allow it to run TNC 2 firmware (see Gateway, Volume 5, Number 9).

Numerous talks were given, including updates on TexNet, TCP/IP, MicroSat, DSP and the HF message-forwarding network. Technical talks introduced a prototype IBM PC plug-in compatible intelligent packet-radio controller by Mike Chepponis, K3MC; a DSP-based analysis by Dan Morrison, KV7B, of filter-type vs phase-locked loop FSK demodulators; and prototype 1.2-GHz transverters designed by Glenn Elmore, N6GN, for use with WA4DSY 56-kbit/s modems.

The theme of the weekend, or, at least, the most discussed subject, was TAPR's support for some type of new Amateur Radio license class that does not require a knowledge of Morse code. The TAPR board of directors, which met on the 24th and 25th, appointed Harold Price, NK6K, to oversee the generation of a specific proposal by TAPR. That proposal is to be forwarded to the ARRL No-Code Study Committee.

Newly elected TAPR board of directors were announced:

Franklin Antonio, N6NKF;
Bdale Garbee, N3EUA;
Steve Goode, K9NG;
Eric Gustafson, N7CL;
Lyle Johnson, WA7GXD.

by Jon Bloom, KE3Z

CALL FOR PAPERS: ARRL COMPUTER NETWORKING CONFERENCE

The eighth ARRL Amateur Radio Computer Networking Conference will be held on Saturday, October 7, 1989, at the Air Force Academy in Colorado Springs, Colorado. Technical papers are invited on all aspects of Amateur Radio digital communications via ionospheric, tropospheric, meteor-scatter and satellite modes. Topics may include network development, architecture, protocols, standards, hardware, software, modulation and encoding schemes, applications, frequency planning and practical experience, such as traffic handling. Of particular interest are digital signal processing, digital speech and image transmission, and new space programs employing digital communications.

Prospective contributors should request an author's kit and identify the topic of their paper immediately. The deadline for receipt of camera-ready manuscripts is August 28, 1989. Author kit requests and camera-ready manuscripts should be mailed to Lori Weinberg at ARRL headquarters.

Printed proceedings will be available at the conference and by mail from ARRL headquarters.

PACKET RADIO IN WEST GERMANY

In the following exclusive Gateway report, Ekki Plicht, DF4OR, the official in charge of visual communications for Deutscher Amateur Radio Club (DARC), describes the state of the art of amateur packet radio in the Federal Republic of Germany, where it is one of the fastest growing, if not the fastest growing, Amateur radio mode.

In the Beginning...

Packet radio in DL-land started on one 2-meter frequency, 144.675 MHz. While some enthusiasts enjoyed a quiet frequency and made connections through the whole country, even DX contacts into France, Switzerland and Austria, the growing interest in this new form of communications made efficient "normal" digipeating impossible, due to the increase in the number of collisions. So, in those early years, DARC started to develop a plan which would offer reliability and promise for future years. This plan stated that

- On 2 meters there are too few frequencies for packet radio (exactly three for digital communications);

- Therefore, user input frequencies should be placed on 70 cm and higher;

- Internode communications should take place on 23 cm and higher and the link between two nodes should be exclusive and realized with directional antennas and the lowest power possible.

This scheme developed well, although some people still favor 2-meter operation due to availability of less expensive equipment.

To understand the situation in West Germany, let me explain some of the more important differences between West Germany and US. The 2- meter band is much smaller than in the US (only 2 MHz, from 144.000 to 146.000 MHz). Digital communications occur from 144.625 to 144.675 and 145.300 MHz. This is not enough for a network, since there are still other digital activities besides packet radio, such as RTTY, FAX, etc.

On the average, West Germany is more densely inhabited than the US, thus, a digipeater has to serve a greater number of users. To avoid collisions between digipeaters serving different areas on the same frequency, they should not be located at good DX sites. Therefore, it is necessary to install a large number of medium-range digipeaters in order to build a nationwide network. This is possible only on 70 cm, where enough room is available (10 MHz, 430.000 to 440.000 MHz). (There is no 220-MHz band in Region 1, and 6-meter operation is not allowed in West Germany.)

The Situation Today

In early 1989, 74 digipeaters and 24 PBBSs are active in West Germany. Three digipeaters are still on 2 meters, the so called "NORD><LINK experiment." These are some of the earliest digipeaters in West Germany which were set up to learn about utilization of the 2-meter band for packet radio. Except for one station on 23 cm (a user input), all of the other stations are on 70 cm. The subbands used on 70 cm are:

- 433.625-433.775 MHz: simplex, digipeater, station-to-station

- 438.025-438.175 MHz: simplex, PBBS, digipeater, station-to-station

- 438.200-438.525 MHz: duplex output, 7.6-MHz shift, digipeater (not yet in use)

Duplex digipeaters are preferred for their improved throughput and collision avoidance, even though they consume twice the space. Besides, they are a perfect way to defend our endangered 70-cm band. (For a fair presentation of the situation here, it must be said that ATV operators are not happy with the frequency allocations in the upper part of the 70-cm band.)

All nodes use 1200-bit/s modems on the user frequencies with one experimental station near Bonn using 4800-bit/s. Most digipeaters are connected to some other node via 23-cm links. There are still some links on 70 cm, but they will be moved to 23 cm or higher when possible. The

23-cm links are on exclusive duplex frequencies, so collisions should be minimal.

The necessity of using 23 cm for internode communication led to some interesting developments in UHF equipment. To name one, there is a reasonably-priced, one-watt transceiver kit developed by DF9IC and DL5UY from Karlsruhe, that is capable of 1200-bit/s, half-duplex operation. It is ready to connect to a 1200-bit/s AFSK modem and covers the 23-cm band from 1240 to 1300 MHz.

Many experiments are taking place on higher frequencies. For example, in the Munich area (Bavaria), some experiments are in progress using the 6-cm and 10-GHz bands.

PACKET RADIO IN WEST GERMANY - (Part 2)

Modem Hardware

Besides the standard 1200 bit/s modems using TCM3105, AMD7911 and XR2211 chips, there are other modem developments. DJ4ZC of AMSAT-DL has developed the "RSM-Modem" which uses rectangular spectrum modulation. It is capable of 9600 bit/s full-duplex operation and is under test on two digipeaters. NORD><LINK's DK4EG has developed a 4800-bit/s modem. Elsewhere, tests are being conducted with G3RUH's 9600-bit/s modems.

Digital Hardware...on Hilltops

About 50% of the digipeaters in West Germany use standard TNCs including many compatible clones of the well-known TNC 2. Most, if not all, use NET/ROM or TheNet.

Another large number of digipeaters use the so-called "RMNC" (Rhein-Main-Network Controller) which was developed by DH1FAB and others in Frankfurt. It uses the 6809 microprocessor and is contained on one printed circuit board that includes the CPU, 32-kbyte of RAM, 32-kbyte of ROM, SCC, VIA and a TCM3105 modem. It is available at a reasonable price.

A few digipeaters use homebuilt hardware or software. For example, the HP9000-series computers with homebuilt slot modems used in the Stuttgart area running UNIX, another 6809 system running FLEX, etc.

A large number of hams use the Commodore C-64 for packet-radio operation running DIGICOM>64 Version 2 software and an inexpensive user-port modem. Another large chunk of the packet-radio population use TNCs, PK-232s, KAMs or similiar controllers.

Digital Hardware To Come

Rumors concerning recent new hardware developments include a larger CPU for the RMNC by DG8FAC and another board for the RMNC using the H16-series computers by DK7WJ.

Software...on Hilltops

Nearly all of the TNC-equipped digipeaters use NET/ROM or TheNet. Plans are to further improve TheNet as far as code-space considerations will allow. The latest development for TNCs is a converse-mode EPROM from DL8ZAW which is linked to a NET/ROM node via the EIA RS-232-C interface.

Software that is available for the RMNC (RMNC V1.6) includes a simple tool that uses an unchanging routing table in EPROM with no hop-to-hop acknowledgement or connectability.

Another software design is DK7WJ's FLEXNET. It has a lot of capabilities including hop-to-hop acknowledgment (without changing the SSIDs), an information system, MHeard list, converse mode and more. Currently, it is used on one digipeater equipped with professional hardware (6809 multiprocessor), but it will be ported to the low-cost RMNC, resulting in the Version 2 of the RMNC software (whenever I finish the low-level I/O).

In Karlsruhe, DL5UY/N1EOV and DJ0VL developed their own software running on an 68000 OS-9 system, incorporating a PBBS, standard digipeating and TCP/IP facilities based on KA9Q's software.

DK5SG developed another program under UNIX, running on a HP9000 series computer, which includes a PBBS, autorouter and, again, TCP/IP based on Phil's code. This is the so-called "WAMPES" (Wuertemberg Amateur Packet Experimental System). It is currently used by four or five stations in the Stuttgart area. WAMPES now has an extension which makes it compatible to NET/ROM-like internode communications (Layer 3/Layer 4 protocols). FLEXNET (and, by that, the RMNC) will follow by the summer of this year. Thus, we hope to get a consistent network all over the country.

The DARC department for visual communications will try to bring the major software developers of central Europe together for a conference where standardization and extension of the Layer 3/Layer 4 protocol will be discussed.

Software at Home

Many hams use the famous DIGICOM>64 software for the Commodore C-64/C- 128 computers written by DL8MBT. Its capabilities and user interface is nearly unbeaten by any other software. It is also used in the US as well.

People who use TNCs are running TAPR (V1.1.4) or WA8DED (V2.1) firmware. The latter software has been rebuilt by the NORD><LINK group and is available under the name "TheFirmware." It has some nice improvements (clock, MHeard, KISS-mode) and is mostly used as host- mode software.

Today's Topics:
                      AJ3-to-anything adapter
                  Distribution of KA9Q code (2 msgs)

Date: 5 Apr 89 15:31:36 GMT
From:
 mailrus!sharkey!atanasoff!ceres!deimos.cis.ksu.edu!harris.cis.ksu.edu!mac@tut.c
is.ohio-state.edu (Myron A. Calhoun)

Subject: AJ3-to-anything adapter

I'd like to find an AJ3-to-BNC or AJ3-to-SO239 or AJ3-to-anything !-)
adapter so I could use my TH-21AT with an antenna other than its little
stubby-duck. I asked a Kenwood representative at a local hamfest and
was directed to a large parts distributor, but the latter said they
discontinued carrying the adapter over a year ago. Does anyone have
any suggestions?

Subject: Distribution of KA9Q code

For some time, I've been getting mail of the form "I want a copy of your
code but I can't FTP from here". Lately these requests have reached a fever
pitch.

It has gotten to the point where I simply have no choice but to put my foot
down and say that I can't honor any more such requests. Figuring out how to
get a large binary file to somebody through a jury-rigged chain of UUCP
sites and/or FOOBARNET mail gateways is extremely time-consuming and tedious.
I'm sure people would rather have me spend my time coding!

Furthermore, shipping large files like the KA9Q TCP/IP sources through the
mail gateways that do exist to other networks is, in my opinion, abusing the
hospitality of the gateway operators. In most (if not all) cases, these
paths use dialup phone links, with the gateway operators footing their own
phone bills in order to provide a courtesy to others.

If you cannot access the anonymous FTP directories on flash.bellcore.com or
louie.udel.edu, I suggest the following alternative ways to obtain the code:

1. If you are at a university, commercial or governmental institution that
has an internal computer network, jump up and down until you convince your
management that you should join the Internet. With the development of the
NSFNET backbone and the regional networks, Internet connectivity is now
available to almost any organization doing research or development, not just
those with DoD contracts. The Internet is so incredibly useful for so many
things that it is becoming at least as essential as telephone service for an
awful lot of people.

2. If you cannot get on the Internet, find a friend who *is* on the net and
get them to fetch the code for you. I encourage people to set up informal
"networks" to distribute copies of my code to their friends, as long as the
use is non-commercial. You may ship disks around, use bulletin boards or do
direct phone or packet radio transfers; your choice. I strongly encourage

those with Internet access to make current copies of the code available to others, e.g., by public access UUCP a la N3EUA's or WB3FFV's UNIX systems. Given the time it takes to send the stuff even at 2400 baud, I'm sure these two systems could use some help in sharing the load.

3. If all else fails, wait until the new releases are announced as being available through the TAPR office on floppy. You will have to wait a while, as TAPR prefers to deal only with "official" releases, not the "snapshots" of development code I've been regularly putting out for testing.

The only exception I will make to my rule of staying out of the code distribution business is for people who have already proven themselves as contributors to the coding effort. For these relatively few people I am willing to prepare and mail floppies when necessary, but because of the time and expense I am simply unable to do this for everyone who asks.

Thanks for your understanding.

I have finally managed to port the CBBS version of the W0RLI from its
original IBM version to the AMIGA. It will run on a 512K amiga with only
one floppy if absolutely necessary. In order to use it you MUST be able
to use the CLI and an editor in order to configure it for your own environment.
Send me a disk and sufficient postage to pay for return mail. U.S. ops
please note that I will take equivalent LOOSE U.S. stamps but don't stick
them on ur SASE. Canada Post expects me to use Canadian stamps!
If you want me to supply the disk and stamps send a money order for $4.
The disk contains an executable version of the bbs plus the entire C source
code (for Manx 3.6A).

(originally To: DECWRL::"splut!jay@uunet.uu.net" in response to a dialogue on a mailing list)

Yes, Jay, it's not an easy question! How can coordinators make room for new services (i.e., packet repeaters) when FM users have already claimed all of the frequencies?

The problem is basically that YOU are being asked to decide it, rather than allowing the "forces of nature" to take their course. Let's go back a couple of decades to the last two major shifts in band occupancy.

Between 1955 and 1965, the HF fone bands went from mostly-AM to mostly-SSB. The first SSB pioneers got sneers of derision about their "Donald Duck" transmissions, but they crept between the carriers, found their niches, and spread out. Eventually the AMers shrank back to niches and today they have a single spot on each band. No coordinator made up a bandplan; the bands just evolved.

Between 1968 and 1971, 2M went from mostly-AM to mostly-FM. In 1967, I belonged to an AM net that met on 146.898, weekly, and to a "midnight net" that met on 145.71. Local activity was centered on 145.32. This was in Northern NJ, btw. The .898 net moved down to .71 by 1968 or so, as 146.94 got busier as the National FM frequency. Then the FMers filled up the 60 kHz channels from 146.94 to 146.64, then the "splits". The uniform 600 kHz repeater business took place around '71, creating the FM bandplan for 146-147. FM stayed above 146, though; OSCAR was to claim 145.8-146.0. And the FCC noticed and allowed Techs to move into the previously-empty space above 147. Eventually the AM retreated to niches around 144.3. That evolution was pretty smooth, except for the chaotic era of the Walkerrules.

I was the editor of 73 Inc.'s "World Atlas of Repeaters 1976". That was the first wide-ranging repeater atlas to feature maps. I did a LOT of work putting it out, checking hundreds of club newsletters, etc. I couldn't just ask the coordinators who was where; not every area had one, and not every repeater was coordinated. But there were only a few places where hams didn't work things out amicably. In the NY area, co-channel repeater spacing was sometimes as low as 30 miles. Yeah, they argued, but it wasn't all that different from 20 meters -- you try to avoid interference and understand that the bands are crowded. Or you have a repeater war for fun. (Why not? Many of the repeaters were totally redundant, just there for ego-tripping, so repeater operation

was itself the thrill, not repeate use. And repeater wars are the Radiosport of repeater ownership.)

Eventually FM repeaters were allowed to claim the 144.5-145.5 band, and when packet came out, all that was left was the simplex space around 145.0. All of the repeater pairs had been given out (in many areas), by the time the FCC's coordination procedure was recognized.

Now the repeater wars of 1972 weren't all good (or all bad, really; I enjoyed watching some) but the FCC's recognition of coordination really stopped evolution dead in its tracks. Coordinators were no longer "voluntary", making their job tougher. After all, before, if you didn't like their decision, you could ignore them, and if the "free market" was with you, the coordination would become nugatory or moot. Now, though, they're effectively stuck playing Gosplan, allocating resources among competitive interests, with little or no market mechanism.

So what's a coordinator to do? Well, there are two approaches. One (which is rather idealistic) is for coordinators to declare their decisions "non-binding", legally, so they revert to their 1972-era standing. They could also declare some coordinations to be more binding than others, "protecting" only a critical backbone of repeaters, and "suggesting" frequencies to others on a purely voluntary basis.

Another is for the coordinators, in their unpleasant GosRepeater role, to recognize that FM voice users are no longer so preponderant on 2M (and elsewhere; I just know 2M better) that they deserve as large a percentage of the band as they did in 1979. New, non-voice allocations could then be made where voice allocations already exist.

Which exisiting allocations get booted? Well, in a "free market", the least-used and most private machines would be the easiest ones to, uh, "share frequencies with" and "encourage them to move". The 3-user PL-access machine on Joe Bxzftlp's roof 30 miles outside of town might be a good frequency to "share". So a coordinator would prioritize existing allocations and ask the low-priority ones to move. Maybe let someone offer to buy a new set of crystals.

Prioritization of amateur operation is no fun, but one could posit someting like this:

1. Open repeaters with high usage.

2. Closed repeaters with high usage.

3. Open repeaters with little usage and unique features.

4. Closed repeaters with little usage and unique features.

5. Open repeaters with little usage and no unique features.

6. Closed repeaters with little usage and no unique features.

7. Historical allocations no longer actively used.

Others might give more weight to openness; I tend to accept closed-ness if there's justification, such as experimentation. Individual coordinators, of course, would get to make up their own priorities and apply them to the user base as they see fit. The low-priority allocations then have to double up on frequencies, or use closer co-channel or adjacent-channel distances to find new homes. That can free up a few repeater pairs for packeteers and other future users.

It's not an easy situation, but ham radio is stagnant enough without applying the Force of Law to maintain frequency allocations in a time warp simply because to change them would force some users to retune their radios or, heaven forbid, learn to share frequencies. I know from sad experience that 2M packet is a total mess, and I know from technical analysis that full duplex repeaters give far more than twice the throughput of single-frequency digipeaters. But to gain such efficiency, we need repeater pairs, and they're all full up.

That's why I think the FCC's coordination rules are a disaster. They can be changed, or the coordinators can recognize the problem and, at the risk of making a few enemies, do the tough job themselves.

copied from packet:
Subj: TINY-2 MOD (corrected)

PAC-COMM FACTORY MOD FOR TINY2 & MICROPOWER TNC This mod is for Units that have lost their ability to de-code packet unless driven hard from the speaker jack with a huge amount of audio. Paccomm has told me they are having problems with some boards and they cannot figure out why, but they do offer this fix. I had one for over a year that worked fine, then all of the sudden it changed and required 1/2 of available volume from a Icom 38A to decode properly. I just purchase another Tiny-2 from the factory, the new units are coming thru with this MOD already done. No, the modem chip is not the culprit, I changed the TCM3105 and it did not help. I'm sure if anyone does figure out the problem, that Paccomm will be obliged. If you are a registered ownwer of one of these units, a call to them will get you the Mod ready to install. For those who want to "roll their own", I offer the following discription of the modification. (Please note, if you have seen a earlier version of this message from me, it is erroneous.) The mod is installed in a NEW 16 pin IC socket that plugs into U-16, the socket for the TCM3105. Once new socket is plugged into the U16 socket on the TNC board, re-insert the TCM3105 into new socket.

PARTS NEEDED:
1 16 PIN IC socket
2 10K resistors (brown-black-orange)
1 2222NPN transistor (EGC-123AP)

Clip pin 5 on "NEW" socket, leave enuff to solder to,
but cut off enuff of pin so it wont make contact when
you insert this socket into old one. Solder EMITTER
to pin 12 of new socket. Solder 1 resistor from pin 5
to pin 1 Solder BASE to 1 resistor, other end of
resistor to pin 2 Solder collector to pin 5 Thats it!
Hope this clarify's what Paccomm has done. 73's

A couple of years ago I bought the DIGIPAC packet terminal program from
Kalt in Alaska. The system works well in most respects. The printer
function, however, does not work at all, it only gives me strange error
messages. I have tried the system on an XT and on a 386, with my
Proprinter.

The company does not answer my letters, and as their ads have stopped showing
up in QST and HR, I guess they are out of operation.

If you have had the same problem, and have the cure for it, please assist
me - I would like to continue using DIGIPAC

I would also appreciate information on the COM1-COM8 version of DIGIPAC.

Can somone please fill me in on what I need to operate TCP/IP on Packet.
I have nrnet, a TCP program for the IBM, but I can't seem to access ax0,
suppossedly the serial port leading to the TNC. I think I need a settings
file. Can I create one myself? Need I have an IP address assigned to me
for use on Packet?
As you can see I know little about it, but I would very much like to find
out.
Thanks to all, Joe, KC2YU, skohc@cunyvm

Repeater wars were disastrous to those who didn't expect them, or
who didn't know how to cope with them. Malicious interference was
part of some such wars, and should not be condoned. That's different
from the "wars" that go on constantly on the DC bands, where QRM is
simply expected.

>>I don't want coordinators to order anyone offf the air. Repeaters

>Besides, there's that word "priority" again. We can't establish
>priorities.
>Your plan is not politically possible.

Co-channeling repeaters where they are warned that they have some

overlapping coverage is not the same as putting two open repeaters
five miles apart on the same pair. Commercial users have gone
to PL, anti-PL, etc.; these techniques work, especially when the
primary coverage areas differ but secondary areas overlap.

Even a binary priority is a priority. Guy On The Air has priority over
Guy Not On The Air. I see it as quite politically possible to change
this, though the Guys On THe Air (once every month) won't like it.

>The marketplace may do it, but it will do it within the bounds of
>frequency coordination.

If I were to go to my local coordinator and say I wanted a packet
repeater-pair, and he followed your rules (I don't know whose he
follows, so this is a hypo), then he'll say, "fine, get on the
waiting list." I'll no doubt have my channel by April 1, 2007.
That's not a marketplace issue -- lots of semi-idle repeaters still
take up frequencies.

Again this may stem from experiences -- mine in NYC differ from yours
in TX. (It's more peaceful in NE where I live now.) A few repeater
overlaps were annoying, but owners worked things out in various ways.
So long as everyone knew that they had no God-given right to total
exclusivity, and didn't cause MALICIOUS interference, things worked.
I have heard some obnoxious californians who obviously needed more
uh pursuasion.

Still, coordinators have more options than to simply make waiting
lines and leave all intact allocations totally free of sharing.
    fred

Anyone who has any contributions, bugs or suggestions for the IBM-PC
packet driver collection should send them to me. I'm going to put out
a new release of the packet drivers soon. This release will include
globally unique handles[1], user documentation[2], Kelly McDonald's
Novell packet driver support, and Karl Auerbach's PCIP packet driver
support. The last two will be distributed separately because not
everyone will want them.

[1] Required for Phil Karn's TCP/IP package to support multiple packet drivers.
[2] People seem unwilling to read the source when they can't grok the
    parameters. I don't understand why... :-)

Just another short comment on the points that Jay Maynard has been making here.

1. Everything is "politically impossible".
2. "No benefit is enough to put up with repeater wars".
3. "We can't establish priorities".

Flame on:

In short no one can do anything... give it up guys... voice repeaters own the spectrum... there is no solution...

Jay, you've convinced me... you have no solution. In fact I am THROUGHLY convinced that you will NEVER find a solution. The packet people aren't even allowed to BUY a frequency! You've got all the bases covered. There is no possibility for change, etc., etc. You have now shot down the suggestions from every single person on this but have offered NONE of your own as an alternative. As you can see it is starting to get to me a little bit. Sorry.

Flame off:

I have another idea. I am sure it will sound stupid and there will probably be something wrong with it, but it may get around the coordinators and the FCC.

Who says that we have to use 600 khz offsets for duplex packet work? The coordinators don't control SIMPLEX frequencies. Is there a law somewhere that would prevent someone from using say, 145.09 and 147.555 for a duplex packet split? It would be cumbersome to the user and would require using a radio that supports non-standard offsets.... but it would obviously work and would require less hardware to accomplish than a 600 khz split repeater.
I am not advocating this for everyone, but for areas that are already chock-a-block full with voice repeaters already it offers an alternative. Or are all the simplex freqs designated to certain users?

I expect to get flamed on this, but in the process maybe we can hear more alternatives and not the "you can't get there from here" messages.

Fast Packet Systems

By: Simon Taylor G1NTX

From CONNECT INTERNATIONAL - April, 1989. Copyright 1989 by
    Radio Society of Great Britain. Reprinted by permission

For some time now I have been interested in the discussions going on regarding fast packet and data links using RF modems, specifically 9600 bits per second (bps) modems. There seem to be two schools of thought:

1) To use modems connected directly into transceiver IF strips and modulate the carrier directly with data.

2) To connect the data modem via the audio connections of the rig, and operate in a similar way to the technique use on 3KHz bandwidth telephone lines. A colleague of mind (G8DXZ) and myself have proved that this technique works up to 9600bps and we plan to try 14,400bps modems soon.

The purpose of this article is to disscuss the latter technique and (hopefully) stimulate some interest and maybe even some more experiments with these modems.

THE PRINCIPLES

Telephone modems, because of the transmission medium must operate within a 3KHz bandwidth. The frequency response of the telephone line is normally quoted as being between 400Hz and 3400Hz. Most people are familiar with normal frequency shift keying (FSK) using two different tones as used in existing packet radio, but to go must faster than 1200bps within a 3KHz bandwidth requires some further thought.

The first principle used is Phase shift keying (PSK) which uses one audio

tone (the carrier) with phase changes introduced into this carrier which can be detected at the receiver. The advantage here is that one phase change can theoretically be introduced every cycle of the carrier and if four types of phase changes are used, then two bits can be encoded per sampling time.

Secondly, amplitude changes can be added so giving more combinations and more bits encoded per sample time. At this stage, we should introduce another iece of jargon - the Baud. Baud defines the sampling time, i.e. the rate of Phase and Amplitude changes, so for example if four bits are encoded during every baude, and the 'Baud rate" is 1200, then the effective bit rate will be 4800 bps.

Given below is a table showing some half-duplex modulation techniques and their data rates.

Technique	Bit rate	Baud rate	Bits per Baud	Phase Changes	Amplitude Changes	Carrier Frequency
V.29	9600	2400	4	8	1	1700
V.29	7200	2400	3	8	0	1700
V.29	4800	2400	2	4	0	1700
V.27	4800	1600	3	8	0	1800
V.27	2400	1600	2	4	0	1800

Another aspect of these modems is that of 'training'. When data are sent, they are scrambled to made sure that all of the data points are sent even with no data being sent. This makes most efficient use of the transmitted spectrum. The receiving modem will synchronise to the transmitting modem, keeping track of the phase changes as transmission goes on. This traning does take some time however, and will cause time overheads if the channel is turned around frequently. The main reason for training using these patterns is to determine the phase and amplitude restrictions of the path, and to set up an equaliser that is used to give a flat response during data transmission. The modems we have tried also employ 'adaptive equalisation' which will adjust equaliser values during data transmission for small changes in the quality of the received signal.

The time taken to train may make transmission using this faster data mode an overhead rather than an advantage if only small packets of data are sent. V.29 for example, needs 270 milliseconds to train before any data are sent, which is equivalennt to about 40 characters of information at 1200 bits per second. Therefore, we should send at least this amount of data and preferably more to take advantage of the higher data rate after training.

Below are some packet sizes and the times to transmit using existing 1200 bps packet versus V.29 at 9600bps.

Packet Size (chars)	Time @ 1200bps	Time @ V.29/9600bps
20	0.133	0.286
50	0.333	0.311
100	0.666	0.353

200	1.333	0.436
500	3.333	0.686
1000	6.666	1.103
2000	13.333	1.936

Times given is seconds.

From the table it can be seen that the larger the packet, the greater the advantage. It may be that this mode of transmission is not suitable for use with the existing AX.25 standard, but some sort of alternative protocol could be used (or developed) which will not transmit until it has a certain amount of data to send. Further discussion about protocols is beyond the scope of this article, I shall leave it to the national packet network...

Remember that these modems are designed to operate within the 3KHz availaable on telephone lines and a larger audio bandwidth is normally used on VHF/UHF FM, so the quality on a good path is usually found to be better than that obtained via our national telephone system.

THE PRACTICE

There are a number of modem devices which can be used for the audio modulation part of a fast RF modem. Connection to a rig can be simply via Audio in, Audio ouut and PTT and these modem should be simple to connect to existing TNC's such as the G0BSX-2 or similar, but I have not tried this yet. So far I have tried communications using an IBM-PC directly controlling the modem and PTT without any rigid packet structure as such, but this has proved that the principle at least works on VHF and UHF FM.

All of the modems I have tried have been similar in that they require CPU control via a bus which is 8080 compatible and have simple audio in and out connections. All that has been needed is a D>C> blocking capacitor between the modem output and the microphone input (some rigs may also need some reduction of the signal), and a capacitor from the earphone output of a typical rig. A relay should then be driven to control the PTT.

Suitable modems I have tried include:

The R96MD, this is a V.29 and V.27 modem primarily intended for FAX machines, but makes an ideal half-duplex data modem. This device is supplied on a small pCB with two rows of pins allowing it to be assembled like a large DIP device. It will opeate from 9600bps down to 2400bps, as well as at V.21 at 300bps FSK. DTMF is also provided which may be of use to some amateurs. This modem, because of it's application in FAX products benefits from a reduced cost due to it's use in massive volumes.

The R96MFX and R96EFX, these are CMOS single-chip modems with similar features too the R96MD. The R96EFX is especially interesting because it has a V.27 short train feature, training in 50 milliseconds instead of the 270 milliseconds standard, and HDLC packetising and error detection built-in, so avoiding the need for external HDLC controllers.

We soon plan to try toe R144HD which is a V.33 modem which operates at 14,400bps. Again the modem is designed to operate in a 3KHz telephone bandwidth, so VHF/UHF operation should not be a problem.

If you would like data sheets or data books on these modems, then I can be contacted QTHR. Sending out information will not prove a problem.

Also you can leave messages for me at GB3UP (G1NTS @ GB3UP.GBR.EU)

Reference reading:

> "Quality of Received Data for Signal Processor Based Modems" application note (Rockwell 1987 Modem data book), this data book also includes data sheets on all of the modems discussed.
>
> "Rockwell Interface Guide", This gives detailed information as to the connection, use and monitoring techniques used forr these modems, (but is a cost item.)

A possible solution to the problem of getting a repeater pair for packet use may be a time division schedule. Let the repeater be available for voice use during rush-hour and other popular times, and do packet message forwarding, etc during the dead of night (2AM-4AM), and maybe during low use times when most of the voice users are at thier jobs. Allow breaks in the packet time so emergency voice traffic can get through.
I imagine that some low use repeater users (like those semi-private machines) may like having thier machine be put to some use late at night when everyone's

in bed, so they can have more reason to keep the frequency pair for thier
semi-private voice use during the day. Just an idea....

I've not gotten any responses to my earlier inquiry, and I've
proceeded with investigation. I dumped the EPROM, a 27C256, from the
unit, and discovered a fair amount of blank space. The area from 60F0
to 6FFF is all 0's, and the space from 7020 to 7FFF is all F's. This
looks like enough space to add the complete KISS code. There are what
look like "Howie" code copyright notices in the dump, as well as all
the TNC2 messages, and a little BBS system. It appears to be version
1.1.4, and as soon as I can get a copy of that code for my TNC-2's,
I'll compare them to see how different it looks. There is 32K of ram,
as well.

The CPU is a Toshiba TMPZ84C015AF-6, which means a 6MHz Z80 MPU with
counter/timer/serial IO, and who knows what else, that is a standard
commercial product, with complete information available about the
unit. The data book is on its way, I'm told.

Can someone give me pointers on a development environment for Z80
code? I have DEC-20's, Sun's and XT/AT's available, but no Z80
machine.

Any responses to this message are welcomed. Thanx.

In honor of Dayton, a new Macintosh version of Phil Karn's
TCP/IP code is being released. Pencils ready? Its official
name is 871225.33a4 Macintosh version 1.0. (There wasn't time
for the Mac team to port the new version recently released for
the PC, but they'll have it ready soon.)

Copies will be available at the TAPR booth at Dayton. Since
TAPR doesn't have facilities to dupe Macintosh disks, they
aren't handling distribution of this version on a regular
basis; we're just providing them with some disks for Dayton.
If you aren't coming to Dayton, please send either a Mac
disk with a self-addressed stamped disk mailer, or $5 (to
cover the cost of a disk and mailer) to:

    Doug Thom N6OYU
    1405 Graywood Dr.
    San Jose, CA 95129

Technical questions can be addressed to Doug (thom@apple.com),
or to Mike Chepponis K3MC (k3mc@apple.com).

In case you haven't heard, this version has separate windows
for log, trace, and commands/sessions. It also runs nicely under
MultiFinder, so it's easy to keep both NET and BM up and running
and switch between them.

Enjoy!
Patty

In PACKET-RADIO Digest V89 #108, Jay Maynard writes:

>We're not perfect. In addition, there will be cases where two repeaters
>are co-channeled in accordance with the coordination standards, but
>still occasionally interfere with each other. This is inevitable due to
>the vagaries of propagation. The specific case you're complaining about
>has been happening for over 10 years.

Good grief. Then maybe this is the year for action by the coordinator(s)?

>>Some coordinators have been using pencil and
>>paper until this year to keep track of what machines are operating where.
>What would you suggest they have used before the advent of personal
>computers?

This is 1989. I have owned a personal computer for a decade now which
can do what a coordinator needs. In an age of increased need for
spectrum, it does not pay to sit around 10 years before attempting to make
maximum usage of a band.

>>This is no better than amateurs installing repeaters on a frequency of their
>>choice. I have called a 'frequency coordinator' before and tried to work
>>out an interference problem. He responded by saying something like,
>>"You need to give me information on a particular action you would like to
>>take. How can you expect me to go through these coordinations and
>>help you? Since some of the repeater owners have agreed to coordinate
>>on the condition that the location of their repeater not be disclosed, I
>>can give you no information."

>Well, what did you want him to do? The repeater you're complaining about
>is over 100 miles away from yours. The standard for co-channel repeaters
>is 85 miles.

Since you know about this particular problem, let's get the facts straight.
The standard for co-channel repeaters is 85 miles. The two repeaters in
conflict are 67 miles apart. Without unusual propagation, one can sit at
the base of the local repeater and hear the distant machine. A person
sitting at the base of the distant machine can not monitor the local repeater.
Since local users never key the distant machine, an obvious solution would
be to decrease the ERP of the distant repeater. This is only one of
many solutions, however. What did I expect the coordinator to do? First,
check his coordination data to see what kind of signal levels are probable
at various locations. If something doesn't match, it is very likely that

one of the two trustee's has made a change in his station without getting the neccessary coordination (this happened and greatly aggravated the situation). If no obvious clerical or illegalities (under coordination rules) are involved, I would hope for an alternate solution. Since the coordinator has all of the data for all of the repeaters, he is the only person in the position of making a reasonable guess as to what might work.

>Did you try asking your zone coordinator for another frequency?

Yes. We found 3 possible frequencies that could be used. One of them looks very good. The problem now is navigating through the rest of the red tape to make a change. Since the repeater is on the border of two zones, the second coordinator must be contacted (no telephone until they got a new coordinator). If he agrees to the change, he must then contact the local zone coordinator. This would be done at one of the two bi-annual Texas VHF/FM Society meetings. If no further problems were found, the change could be made. There are multiple people involved, and politics will play a role in the decision no matter what the official policy may be. If the local zone coordinator is a close friend, he may pick up the phone and call the other coordinator the same day I talk to him. If not, he may tell me a year later that there are conflicts in the other zone.

This particular case is one to note. Although the local repeater was on-the-air first and coordinated first (which is the single rule you mention), the coordinator has not revoked the coordination of the distant repeater operator even though one-way interference is a problem. This is a fine example of "no action is the action taken." The distant repeater operator might possibly change frequencies, but contacting three zone coordinators and then waiting for them to convene simply isn't worth his time and effort when he is not personally experiencing any interference.

I personally do not want for the distant repeater owner to become 'uncoordinated,' because I believe there are technical solutions to the problem. It's really unfortunate the system doesn't work a little smoother.

Thanks, Jay, for your offer of bringing the matter before the board. I really don't want to see that happen because the bickering will have gone way too far for something like a 2 meter repeater.

writes:
>Repeater wars were disastrous to those who didn't expect them, or
>who didn't know how to cope with them. Malicious interference was
>part of some such wars, and should not be condoned. That's different
>from the "wars" that go on constantly on the DC bands, where QRM is
>simply expected.

Malicious interference was part of ALL such wars that I've ever heard of, as well as a lot of other, even less savory things. Do you really want that? I don't. As Mike Waters has said, that kind of thing is even more damaging.

>Co-channeling repeaters where they are warned that they have some
>overlapping coverage is not the same as putting two open repeaters
>five miles apart on the same pair. Commercial users have gone
>to PL, anti-PL, etc.; these techniques work, especially when the
>primary coverage areas differ but secondary areas overlap.

These techniques may work in the commercial world, but there is no covenant there. There is one in the amateur coordination field. We can't unilaterally overturn that covenant.

>Even a binary priority is a priority. Guy On The Air has priority over
>Guy Not On The Air. I see it as quite politically possible to change
>this, though the Guys On THe Air (once every month) won't like it.

If we were to try this, we'd be thrown out and a group that doesn't want to change it would be installed in our places. After all, we're violating our gentleman's agreement.

>If I were to go to my local coordinator and say I wanted a packet
>repeater-pair, and he followed your rules (I don't know whose he
>follows, so this is a hypo), then he'll say, "fine, get on the
>waiting list." I'll no doubt have my channel by April 1, 2007.
>That's not a marketplace issue -- lots of semi-idle repeaters still
>take up frequencies.

No, you'll have your channel sooner than that. Besides, there's always 1.2, 900, ...
The semi-idle repeaters have made an agreement: they put up (to a certain extent) with us telling then where they should operate, and within what technical parameters, and we protect them. We can't unilaterally change that, and that's exactly what you're calling for.

>Again this may stem from experiences -- mine in NYC differ from yours
>in TX. (It's more peaceful in NE where I live now.) A few repeater
>overlaps were annoying, but owners worked things out in various ways.
>So long as everyone knew that they had no God-given right to total
>exclusivity, and didn't cause MALICIOUS interference, things worked.
>I have heard some obnoxious californians who obviously needed more
>uh pursuasion.

During the 20 kHz discussions, this was a common thread: "They use upright 15 kHz channels in the Northeast, why can't we here?"
People who had operated there, and who had moved here, were unanimous: repeaters there were much less usable than they are here. Lots of interference, and lots of arguments, and lots of adjacent-channel problems. The users and trustees of Texas repeaters decided they didn't want that.

>Still, coordinators have more options than to simply make waiting
>lines and leave all intact allocations totally free of sharing.

Technically, you're correct.
Politically, it's impossible to implement.

>Mark Bitterlich

A couple of problems arise. It is probably okay for a ROUTER (ip
gateway, store-and-forward digi, etc.) to do that, since it is not

repeating the signal in real time. It then needn't use the Repeater
frquencies at all (the ones you mention are within the repeater bands
though). But the need is more for true repeaters, since the AX.25
and related "CSMA" channel-sharing methods are more Aloha than CSMA,
and are thus terribly inefficient. Just an analog repeater for packet
would do wonders. That would need a repeater pair.

So using odd-ball frequencies wouldn't be different from using odd-ball
splits for FM: It would get simplex users mad! And it's tough to
implement since many radios have fixed splits. No, a repeater is a
repeater, and should follow standard splits as much as possible.

BTW in some places 1 MHz is still used for some frequencies (146.43
in NJ, I think).

>But Jay, you ARE making an implicit value judgement! "First-come, first
>served, and nothing else matters" is just as much a value judgement as
>"FM over SSB" or "voice over packet".

Nope...first-come, first-served is nothing more than objective, and a
realization of the simple fact that it's next to impossible to move or
shut down a repeater without the consent of the trustee. Given that,
it's only common sense to implement rules that will be respected and
work.
We aren't saying "FM over SSB" or "voice over packet". If you want to
put up an SSB repeater, or a duplex packet repeater, fine. Go for it.
All we ask is that you follow the rules.
(I won't get into the myriad problems associated with SSB repeaters...
but experience shows that, at least as currently implemented in the
two-way world, they leave a LOT to be desired.)

>You keep claiming that there are no other objective criteria by which
>you can assign priorities to competing requests for spectrum. But if you
>look back at the article I posted the other week, you will see that
>almost every potential criterion on my list has a clearly objective,
>quantitative measurement associated with it. For example, it ought to be
>obvious to all but the most obtuse frequency coordinator that SSB takes
>about 5-6x less bandwidth than NBFM, and that packet is quantitatively
>far more efficient in moving formal message traffic than reading it by
>FM voice. These comparisons involve hard numbers. They are not
>subjective value judgements.

The hard numbers are there, but that they should be involved in
coordination decisions is where we differ: the consideration that one
repeater is better than another, and therefore should be given priority
in coordination, is a value judgment.

>What is admittedly difficult to resolve, however, are the relative
>WEIGHTS that should be applied to each of the various objective criteria

>when you're arbitrating a dispute between dissimilar groups. For
>example, how much weight should be given to a large RTTY group that is
>competing with a smaller packet group for a given amount of spectrum,
>considering that packet is much more efficient in its use of spectrum?

That's not just difficult to resolve, it's flat impossible. You'll never
get the respective groups (no matter what the criterion) to agree that
the choice you make is the right one if that choice goes against them.
They will always argue the decision, and will eventually flout it.

>This is something that has to be worked out through open discussion,
>with each group having its say. The ultimate goal must be to meet the
>raison d'etre of the Amateur Service as much as possible. Sticking your
>head in the sand and clinging to the first-come-first-served rule come
>hell or high water simply isn't going to produce an amateur service that
>is capable of holding on to its frequencies.

This kind of thing won't get worked out in open discussion; it'll get
endlessly argued in open discussion, with no option being generally
acceptable. If a solution is imposed, there will always be a disgruntled
faction, and the accumulated weight of unhappiness will eventually bring
the system down, producing the repeater wars that Fred Goldstein wants.
He's the only one I've ever talked to that does, though.
The great advantage of the first-come-first-served rule is that it's
fair, equitable, and working.

Speaking of holding on to frequencies, why can't these new users
populate the other frequency bands? We're going to lose the higher bands
if we don't use them, and if people put as much effort into populating
902-928 as they did in fighting the coordination system, we'd never be
in danger of losing it.

If not us, who?

>The real problem for the coordinator is not only to stay neutral but to be
>SEEN to be neutral! THAT IS TOUGH TO DO!

It's downright impossible if we get into assigning priorities to various
uses of the spectrum.

>The problem is compounded by two other items (a) the coordinator is a
>volunteer - not full time and (b) the coordinator is the "most expert" person
>around on the subject and so cannot simply remain silent.

Which is why I've been speaking out here...It's all well and good to say
"Let's promote packet! Get the low-use repeaters to double up!", but
from where I sit, there ate impossibilities involved.

>Remember that this IS a "political" problem! There are ways that have been
>developed to solve such problems, slow and painful as they are, but there are
>also ways to disrupt the process. We as hams lose if we do let it degenerate
>into a "war" of any sort.

Absolutely. The job is political.
The "solutions" I've seen so far ignore political realities in favor of
technical fun. I'm not anti-techie, despite some comments I've seen, but
the ham population is larger than that, and a significant number of
people don't care about anything but hearing a kerchunk when they let
off the mike.

>is impractical in the amateur service as it exists today. [...]

The problem is that we can't effectively require such a thing. We've
tried to require technical upgrades before, and the net result has been
a revolt within the ranks. People would much rather complain than spend
money. While an increasing number of rigs have PL encoders installed,
either by retrofit or from the factory, only a tiny number have PL
decode capability. Requiring anything like that will simply result in
the current leadership of the coordinating body getting tossed out and
replaced with others who don't presume to spend other people's money.

>By the way, do you have any numbers on the percentage of frequencies
>allocated to various usages? I have never seen any info from any of the
>frequency coordinating bodies.

Outside of frequencies reserved to specific uses by the band plan, that
info isn't really available. I can tell you that 144.91 to 145.09, in 20
kHz steps, is reserved for packet, and that 145.5 to 146.0 is reserved
for satellite, but we don't track things like the 146.10/70 packet
repeater here in Houston.

>3. "We can't establish priorities".

Exactly right.

>In short no one can do anything... give it up guys... voice repeaters own the >spectrum... there is no solution...

No, voice repeaters don't own the spectrum. Whoever has gotten there first has the ability to use that frequency - for whatever choice they desire, including packet - but they don't own it.

>Jay, you've convinced me... you have no solution. In fact I am THROUGHLY >convinced that you will NEVER find a solution. The packet people aren't >even allowed to BUY a frequency! You've got all the bases covered. There is >no possibility for change, etc., etc. You have now shot down the suggestions >from every single person on this but have offered NONE of your own as an >alternative. As you can see it is starting to get to me a little bit. Sorry.

As I said at the beginning of this discussion, I don't claim to have a solution. I was responding to complaints that coordinators won't give packet more frequencies. It's not that simple.
I admit that I don't have the answers. What I do have is experience in the coordination arena. So far, none of the proposed solutions I've seen can work. That doesn't mean that there isn't one that will.

>Who says that we have to use 600 khz offsets for duplex packet work? The >coordinators don't control SIMPLEX frequencies. Is there a law somewhere >that would prevent someone from using say, 145.09 and 147.555 for a duplex >packet split?

No, there isn't. Such a repeater would not have coordinated status, but

as long as it doesn't cause interference, there would be no reason for
that to make a difference.
You might get some (possibly severe) grief from some folks using 147.555
for FM simplex work, as the band plan specifies, though...

>I am not advocating this for everyone, but for areas that are already chock-a-
>block full with voice repeaters already it offers an alternative. Or are all
>the simplex freqs designated to certain users?

No, the simplex frequencies are not allocated at all except to say that
they are for simplex use. There may be an existing group using a
specific frequency, and you might get in a fight with some CD group
somewhere, but that kind of issue doesn't really fall within a frequency
coordinator's purview.

>I expect to get flamed on this, but in the process maybe we can hear more
>alternatives and not the "you can't get there from here" messages.

No flames here. The only time, and the only reason, that I may say "you
can't get there from here" is that experience has shown that you can't.

It may take computers to do it but we should be looking forward to something even more comprehensive. What about voice mail, picture mail and other applications
which can shield the user from seeing computer involvement? I think we need eventually
need this if we are to have mass appeal. (Or don't we want mass appeal?)

>
>An accurate summation. So far, only Fred Goldstein has disagreed with
>it.
And not an accurate summation of my position, either.

Believe it or not, I do spend a fair amount of operating time on the
DC bands, even using manual radiotelegraphy (straight key and cans).
A quiet night on 20M is far more prone to QRM than any "repeater war"
except for intentionally malicious ones.

Repeater frequency conflicts (pre-Gosrepeater) occur in two modes.
One is the all-out "repeater war", when one group intentionally tries
to clobber another one. This is quite rare, and typically falls under
the rubric "malicious interference". Thus it is not prevented by
coordination; previous rules prevented it, and coordination is a

secondary issue. I don't think this is a good way to use the spectrum
either, unless the two groups involved are willing to do it as, say,
a test of interference-reduction technology. And that's not the norm!

But the second kind of "repeater war" is the incidental conflict, when
two repeaters overlap in coverage the way DC band users hear each other
without killing the QSO. If I'm chatting with a CX8 in Spanish, then
it might be disconcerting if some WB4 clobbers him, even if the QRM
wouldn't kill a QSO in my first language. But I don't cry about it;
"them's the breaks". And on VHF FM, we have incidental conflict
when a mobile (or even a sloppy base, who should know better) triggers
two machines at once. Local users usually "capture" but time-outs
occur. We have incidental conflict when squelches break from the
wrong repeater, but that's trivial annoyance and if you don't have
tone squelch, then please don't complain to me that you don't have
absolute quiet on "your frequency"!

Absent Gosrepeater (the current plan), we'd still have voluntary
coordinators, who'd suggest the least-interference route. We'd play
with antenna patterns, PL and anti-PL, etc., to minimize conflict.
We'd act like HAMS. Even like low-band hams, most of whom try to
minimize QRM even if the band has 8 times as many users as "quiet"
bands would have (i.e., average of 8 stations per 3 kHz -- just a
random number). On occasion, there'd be "repeater wars", when
people got upset about the failure of these measures to keep things
from interfering, or when an existing user got peeved about a new one
making things tougher. But what was 20M like in 1929? Probably less
crowded than now. And probably a lot of today's hams were there then,
judging by the age stats!

>
>No, voice repeaters don't own the spectrum. Whoever has gotten there
>first has the ability to use that frequency - for whatever choice they

Just think how easily one of these OOT's could have worked 300 countries
if he could have had the exclusive right to call CQ on 3 kHz of 20M!

Of course you can't ahve "the answers". Because the problem has no
easy solution. Having the FCC grant you the imprimatur to treat
ham bands like commercial frequencies doesn't make things better, it
just changes the problem. I prefer the old problems and solutions.

Concerning this issue, I think that what we are really seeing here is a split occurring among the amateur ranks on what amateur radio is really all about. Jay Maynard has made his points on how he feels recoordination of any repeater is basically impossible for a number of reasons. He has replied to my criticism of "You can't get there from here" with an answer that basically says "That's right"!

His answers and epitomes tended to aggravate me with terms such as "politically impossible" and "value judgments" and his basic emphasis on "he who gets here first gets the goodies and if YOU want some, move to another band".

It has taken awhile but I believe I finally see the real issue here. It is NOT how to get duplex packet frequencies coordinated, I think the idea of using nonstandard splits and living with a little grief from simplex users is feasible to PARTIALLY solve that question. No... the real issue here is support for technical advancement within amateur radio versus "maintain the status quo". It seems that EVERYONE is for technical advancement as long as it doesn't cause ME any inconvenience!

This is the basic line that is always drawn between "users" and "developers". You can even see it within packet radio as people side with TCP/IP or NETROM or TEXNET, etc. Or as a negative reaction to upgrading networks where users might have to reequip to a certain extent! I think it all boils down to a basic resistance to change within our group and I am referring to ALL of amateur radio.

The new player into this equation is the "Frequency Coordinator" which is where this whole string of messages started in the first place! Picture what might have happened if all the frequencies on 20 meters were "coordinated" to nets back when we all were using AM. Along comes a few guys with single sideband asking for some frequencies to use for test and experimentation. They quote increased spectrum efficiency and so forth but the Frequency Coordinator will NOT make value judgments and instead tells them to take their SSB to some other band! Isn't that really what is happening now with this discussion on packet and 2 meters? Sure there are nit-picking differences but the basic concept is the same. In this regard the "FCC's Recognition of Frequency Coordinators IS A DISASTER"!!!!!!!! Darn tooting it is!! Because we are losing the ability to battle it out as a group and instead now have to place the problem in the lap of a SMALL group of people such as those with

the beliefs of Jay Maynard.

I personally react STRONGLY to advocates of "whoever was here first get the goodies"! Why? Because it eliminates anything new... it always will. Not just packet but just about ANYTHING! The only exception being things that everyone sees as beneficial right at the start... and how many things over the years have you EVER seen that meet that definition?

It all boils down to what you believe in. Should amateur radio be renowned for it's innovation and technical advancement or for effective utilization of known technology?

Not everyone can be a Phil Karn software genius or design and build a AMSAT, but I like to think that the vast majority of us SUPPORT those that DO advance our hobby through technical achievement. If it means that a sacrifice sometimes be made... SO BE IT!

But it seems that this is not the case anymore. We have legal suits being instigated against fellow hams, and we see that there is some really EMPHATIC resistance being made to change. Two meter voice repeaters have become almost SACRED to a certain faction among us. This makes me a little sick to my stomach!

It is starting to look like 2 meters is following the route of CB radio. It has established it's structure so firmly that certain members among our ranks say that there is just no way to change it! And maybe this is true to a certain extent. This means that we are basically saying that what we have is better than anything that might come along in the future. The "users" are telling the "developers" to PLEASE GO SOMEWHERE ELSE to play with your new toys, we like what we have and want no part of anything else.

Jay is representing the "keep it as it is" concept and we are pushing the "let's develop new things no matter what" concept. I doubt that we will ever see eye to eye on this, the differences in beliefs are so fundamental as to never be resolved.

But please put me down on record as one who ALWAYS supports development. You don't DEVELOP a status quo, it develops itself... the only thing you can do is to MANAGE it and that just bores me to tears!

Frequency Coordinators make me nervous. Their reason for being was to allow growth with less conflict, but now they allow zero growth to avoid conflict. We have always had conflict and we have always risen above it in the long run, but when the FCC basically gave REGULATORY powers to groups that started life as people that were initially only ADVISORARY in nature, they opened Pandora's box. Now the ADVISORS are afraid to REGULATE and the users refuse to be ADVISED! I can see where "repeater wars" might be better in the LONG RUN than what we are faced with now!

Jay Maynard says that there is nothing that could be worse than repeater wars, I say there is one thing that is worse.... stagnation.

Sorry folks. I sent a copy of my amiga version of CBBS V6.0 to DAyton
with a friend. A few hours after he left I found an insidious bug in it.
Yuk. There is no workaround for it and it can crash the amiga in very
mysterious ways. If you have a copy that has V6.0 in the window title
then it is bad. Give up until you get a later version.
Sorry agn.

>Good grief. Then maybe this is the year for action by the coordinator(s)?

Maybe it's that the folks at W5AC had decided to live with the
situation. We had received no complaints until your email to me last
year. I have no problem with your decision to no longer live with the
problem, but don't flame us for the fact that your group hadn't decided
to complain until recently.

>>>Some coordinators have been using pencil and
>>>paper until this year to keep track of what machines are operating where.
>>What would you suggest they have used before the advent of personal
>>computers?
>This is 1989. I have owned a personal computer for a decade now which
>can do what a coordinator needs. In an age of increased need for
>spectrum, it does not pay to sit around 10 years before attempting to make
>maximum usage of a band.

There's no logical connection between coordinators' record-keeping
methods and usage of a band.
I, too, have owned a personal computer for a long period of time (my
first system, which I still have, is 11 years old), but it's
unreasonable to expect a coordinator to be a PC pioneer. Only in the
past three years or so have reasonably powerful PCs been available at a
price that puts it within reach of the average person who has little
interest in PCs in and of themselves. One of our coordinators has been
working on the program our coordinators will use for about that long.
(He has an honest job.)

>Since you know about this particular problem, let's get the facts straight.
>The standard for co-channel repeaters is 85 miles. The two repeaters in
>conflict are 67 miles apart. Without unusual propagation, one can sit at
>the base of the local repeater and hear the distant machine. A person
>sitting at the base of the distant machine can not monitor the local repeater.
>Since local users never key the distant machine, an obvious solution would
>be to decrease the ERP of the distant repeater. This is only one of
>many solutions, however. What did I expect the coordinator to do? First,
>check his coordination data to see what kind of signal levels are probable
>at various locations. If something doesn't match, it is very likely that
>one of the two trustee's has made a change in his station without getting
>the neccessary coordination (this happened and greatly aggravated the
>situation). If no obvious clerical or illegalities (under coordination rules)
>are involved, I would hope for an alternate solution. Since the coordinator
>has all of the data for all of the repeaters, he is the only person in the
>position of making a reasonable guess as to what might work.

You are correct that the repeaters are 67 miles apart; I was
misinformed.
The actions you mention are reasonable. Is that what you asked the
coordinator to do?
How busy is the other machine?
Can you squelch it out? I would expect that you could, given the
distance involved.
Finally, can you show that the other repeater changed its output power?

>>Did you try asking your zone coordinator for another frequency?
>Yes. We found 3 possible frequencies that could be used. One of
>them looks very good. The problem now is navigating through the rest
>of the red tape to make a change.

Recoordinating a repeater should be a fairly simple process. The red
tape involved is no more intricate than a new coordination.

>Since the repeater is on the border
>of two zones, the second coordinator must be contacted (no telephone
>until they got a new coordinator). If he agrees to the change, he must
>then contact the local zone coordinator. This would be done at one of the two
>bi-annual Texas VHF/FM Society meetings.

The zone coordinators communicate frequently with each other, despite
your insinuation. That a coordinator wishes to do business by mail with
trustees does not mean that other coordinators can't/don't talk to him
more frequently on the phone. The difference is that communications with
trustees need to be tracked and saved, and communications between
coordinators do not.

>There are multiple people involved,
>and politics will play a role in the decision no matter what the official
>policy may be. If the local zone coordinator is a close friend, he may
>pick up the phone and call the other coordinator the same day I talk to
>him. If not, he may tell me a year later that there are conflicts in
>the other zone.

If this really happens, then the state coordinator or the Board needs to
hear about it. I will tolerate no political considerations in the
frequency coordination process, and the coordinators understand this.
If the coordinator is not moving fast enough for you, then you can
either pester him regularly, contact the state coordinator, or contact
me or the Board.

>This particular case is one to note. Although the local repeater was
>on-the-air first and coordinated first (which is the single rule you
>mention), the coordinator has not revoked the coordination of the
>distant repeater operator even though one-way interference is a problem.
>This is a fine example of "no action is the action taken." The distant
>repeater operator might possibly change frequencies, but contacting
>three zone coordinators and then waiting for them to convene simply
>isn't worth his time and effort when he is not personally experiencing
>any interference.

This complaint shows a lack of understanding of the coordination
process. The coordination was issued. Nobody complained. The A&M radio
club (according to one of its members at the time) decided to live with
the problem.
Now, over 10 years later, someone else complains. Is a change of heart
on the part of one of the parties sufficient reason to de-coordinate the
other?

I also must point out, again, that coordinators don't wait for meetings;
they communicate regularly and frequently.

>I personally do not want for the distant repeater owner to become
>'uncoordinated,' because I believe there are technical solutions to
>the problem. It's really unfortunate the system doesn't work
>a little smoother.

De-coordination is the only real threat we can use to convince a
repeater trustee to change his operations. There are technical solutions
available, but the problem is not technical - it's political.

>Thanks, Jay, for your offer of bringing the matter before the board.
>I really don't want to see that happen because the bickering will
>have gone way too far for something like a 2 meter repeater.

If you are really that dissatisfied with the coordinators' actions, then
you have the right under the Society's bylaws to bring the matter before
the Board. That is one of our primary functions. If you have a problem,
and the coordinators don't solve it, then you have two choices: either
live with it or let the Board know about it, and get help that way.

>>   fred k1io

Fred, I agree with you on most of the things you have said in previous messages but you have lost me on this one! I seriously don't understand what the problem is.

The thoughts that I have are as follows:

1. If you going to end up making some people irate anyway, is there a way to affect LESS people and cause LESS of a financial setback? If you end up trying to move an established repeater, then you are in for a battle. Not necessarily impossible mind you (I don't agree with Jay Maynard :-) but a battle none the less. If you cause a problem to simplex users they only need to change to another simplex freq., (a flip of the dial) not redo a whole repeater.

2. Most radios today DO support non standard splits. The ones that don't are the exception to the rule. You name me one that doesn't (and I know there are a few) and I'll name you 10 that do. :-)   And if you really just HAVE to use one that doesn't support it (such as an ICOM IC-2AT) then you can easily modify it to where it does. Am I out to lunch here?

3. Using a wide split with non standard freqs. would require less isolation in the form of cavities and antenna separation... thus cheaper. I always meant for the idea to be used for full duplex digipeaters (nodes) not as a

store and forward system.

4. I am going to jibe you a little here.... "A repeater is a repeater and should follow standard splits". Who says so? I would rather break away from the conventions of voice systems rather than follow them. It's like using 200 Hz shift on HF packet... 600 would work better, so why not use it?

After all, guys that are talking on simplex could easily find some unused repeater to use instead, and think how happy they would be! (That's a joke, no flames, no flames :-)

Lastly and as an adjunct, have you read about the proposed idea of using DAMA (Demand Assigned Multiple Access) instead of CSMA on packet radio? The idea seems to have merit and solves the problems of hidden transmitters in a much more elegant fashion than a duplex digi... although I agree that duplex systems are pretty slick.

In the June 1989 issue of Popular Communications (Page 42) is a piece about the Coastguard using packet. Here is the item:

"
One day recently, Kenneth MacLeod of Washington State turn on his ICOM IC-R7000 scanning receiver and tuned to 171.155 MHz, where he picked up a 1200-baud packet radio transmission of the U.S. Coast Guard. He monitored NAVH, USCGC Pont Bennett and NMW47, USCG, Bellinham, WA., exchanged traffic between 0130 and 0200 UTC.

Ken would like to hear from any of you who may have piked(sic) up similar transmissions on 171.155 where you live. You may write him at P.O. Box 2495, Friday Harbour, WA 98250.

"
Yours

To me, one thing that comes across very clearly from this discussion
is that Mr. Maynard has no solution to this problem. If this is an
important enough problem, I would encourage him to resign and let
someone else deal with it.

Another thing that I get out of this discussion, is that any "value
judgements" that are employed must not be that of one or two
individuals, but of the whole group in the frequency coordinated area.
(Remember the language in the announcement where the FCC recognized
frequency coordinators that they derive their "authority" by consent
of the people that they are coordinating).

I think that there is indeed a political solution to the repeater
usage problem. Those who do not like it should band together and call
for a special election. Then make it an issue in the election of
whether or not perpetual frequency assignments for repeaters or other
users will be supported by the ham public. This may end up voting
the current frequency coordinators out of office. More importantly,
it makes the issue one of public debate amoung the whole group, and it
may be politically possible then to follow through with whatever the
outcome is.

However, an election is a two-edged sword. Those people who will want
to keep their allocations will probably be very interested in
retaining the status-quo with "educating" the users of their repeaters
about their own point of view. So be prepared to do your own
"education", persuasion, or whatever. And the repeater users may end
up out voting you. If this happens, you can simply do more
education, and try again later.

To the best of my knowledge, the FCC did not make a frequency coordinator's tenure permanent. I did not recall a specific procedure set up by which one recognizes a new one, though.

Where there is a will, there is a way....

ATTENTION -- HAM TESTS

At 10 am, Saturday, May 6th, W5YI examinations will be given at the University of Maryland in College Park, MD.

Tests are sponsored by the U of M ARC. Bring $ 5.00 and positive photo I.D. to the Student Activities Building, next to the TERPs basketball stadium. Testing is near room 114, on the same end of the building as the video arcade, next floor up.

>more damaging.

Last night there was quite a "war" on my favorite frequency (14.010),
caused by a rather large number of people interested in working a JY9.
And an even bigger one at 14.198 surrounding a YI2. Yet I heard no
malicious interference, just a lot of people playing the game. I did
however hear quite a bit of malicious interference on 3.895, with
fewer than a half-dozen operators trying to carry on a silly
conversation (about par for that band).

I don't want malicious interference, but we have separate rules about
it. Nonmalicious "interference", the inevitable result of sharing
frequencies, is at the heart of ham radio.

>>Co-channeling repeaters where they are warned that they have some
>>overlapping coverage is not the same as putting two open repeaters
>>five miles apart on the same pair. Commercial users have gone

>covenant there. There is one in the amateur coordination field. We can't
>unilaterally overturn that covenant.

Covenant? Interesting term. Is that as in a deed restriction, or
as in what in Hebrew (Ashkenazic) is called "bris"? Sorry, but my
ham license disclaims frequency ownership.

>The semi-idle repeaters have made an agreement: they put up (to a
>certain extent) with us telling then where they should operate, and
>within what technical parameters, and we protect them. We can't
>unilaterally change that, and that's exactly what you're calling for.

Yes, you can unilaterally change that! Conditions change, and
the terms of grant change. How do you think the clear channel AM
broadcasters felt when the FCC loosened up the AM rules? The AMST
complained but the frequencies are the public's, and the FCC is
exercising judgement over what is the current best way to use them.

>During the 20 kHz discussions, this was a common thread: "They use
>upright 15 kHz channels in the Northeast, why can't we here?"
>People who had operated there, and who had moved here, were unanimous:
>repeaters there were much less usable than they are here. Lots of
>interference, and lots of arguments, and lots of adjacent-channel
>problems. The users and trustees of Texas repeaters decided they didn't
>want that.

That doesn't really relate to abolishing Gosrepeater coordination.
The bandplan and the allocation of channels are two different
issues. I rather like the inverse-split 15 kHz (California) plan,
but we don't really have problems with the 15 kHz plan here any
more; we're used to it.

Sure, it was a pain at first, but we chose our frequencies more
carefully, use tighter crystal filters, etc. Basically, we decided
as a whole that the 1971-vintage radios weren't adequate any more.
Sort of like the way we stopped running AM at 14.210.

>secondary issue. I don't think this is a good way to use the spectrum
>either, unless the two groups involved are willing to do it as, say,
>a test of interference-reduction technology. And that's not the norm!

This is exactly what I refer to when I say "repeater war". Any
coordination conflict can, and usually will, result in this kind of
disreputable state of affairs. This is the kind of thing that led to
frequency coordination in the amateur service in the first place. This
kind of thing is why frequency coordination is used by the amateur
community: because they had it, and don't want it any more.

>But the second kind of "repeater war" is the incidental conflict, when
>two repeaters overlap in coverage the way DC band users hear each other
>without killing the QSO. [...]

You're the only person I've ever seen who calls this a repeater war.
Even this level of interference causes problems: witness the discussion
I've been having with AA5AV here about just such a conflict.
Your assertion that people in the Northeast tolerate such is only
marginally applicable here: the Texas amateur community decided that
what's usable in the Northeast is not necessarily usable here, and they
wanted a higher quality of service.

>Absent Gosrepeater (the current plan), we'd still have voluntary
>coordinators, who'd suggest the least-interference route. We'd play
>with antenna patterns, PL and anti-PL, etc., to minimize conflict.
>We'd act like HAMS. Even like low-band hams, most of whom try to
>minimize QRM even if the band has 8 times as many users as "quiet"
>bands would have (i.e., average of 8 stations per 3 kHz -- just a
>random number). On occasion, there'd be "repeater wars", when
>people got upset about the failure of these measures to keep things
>from interfering, or when an existing user got peeved about a new one
>making things tougher. But what was 20M like in 1929? Probably less
>crowded than now. And probably a lot of today's hams were there then,
>judging by the age stats!

You have an annoying habit of assigning provocative names to things. I
bet you agree with Tim Sevener's tactics in talk.politics.misc, too.

We do play with antenna patterns, ERP, and other technical factors to
insure little to no interference between repeaters. We won't tolerate
Northeast-level "usability", though. We are acting like hams. The
difference is that we do not consider any significant level of
interference satisfactory unless the trustees involved agree to it. If
they do, fine, but we cannot force them into it.

>>No, voice repeaters don't own the spectrum. Whoever has gotten there
>>first has the ability to use that frequency - for whatever choice they
>>desire, including packet - but they don't own it.
>Just think how easily one of these OOT's could have worked 300 countries
>if he could have had the exclusive right to call CQ on 3 kHz of 20M!

Aw, cmon. You're being deliberately obtuse. There's a world of
difference between 3 kHz of 20 and a repeater coordination: the repeater
coordination can be geographically reused.

>>I admit that I don't have the answers. What I do have is experience in
>>the coordination arena. So far, none of the proposed solutions I've seen
>>can work. That doesn't mean that there isn't one that will.
>Of course you can't ahve "the answers". Because the problem has no
>easy solution. Having the FCC grant you the imprimatur to treat
>ham bands like commercial frequencies doesn't make things better, it
>just changes the problem. I prefer the old problems and solutions.

You're the only person I've talked to who wants to return to the bad old
days.
Like any other complex problem, this one has a number of simple, easily
understandable, easily implementable wrong answers. The coordinating
bodies are in the trenches working to find the right answers. The FCC's
action made our job a little easier; to those of us working to find the
answer, it's not a disaster. It's a greater responsibility.

>His answers and epitomes tended to aggravate me with terms such as
>"politically impossible" and "value judgments" and his basic emphasis on
>"he who gets here first gets the goodies and if YOU want some, move to
>another band".

So far, I haven't seen a different answer that would be perceived as
fair and equitable.
I'm not happy with the current state of affairs either, but I honestly
know of no better way to get there from here. I know, from first-hand
experience, that the things I say are politically impossible are indeed
so; I've floated a number of them in discussions with hams around
Texas. First-come-first-served affects me, too; if I wanted to put up a
2-meter repeater, I couldn't get a coordination. It affects everyone
equally, unlike any other system.

>It seems that EVERYONE is for technical advancement as long as
>it doesn't cause ME any inconvenience!

The "not in my backyard" factor is indeed alive and well. I didn't
create it, but I'd be a fool not to recognize it.

>In this regard the "FCC's Recognition of
>Frequency Coordinators IS A DISASTER"!!!!!!!! Darn tooting it is!! Because

>we are losing the ability to battle it out as a group and instead now have to
>place the problem in the lap of a SMALL group of people such as those with
>the beliefs of Jay Maynard.

People in the position of frequency coordinator have generally come to the same conclusions as I have for one reason: we've been here doing it. Battling it out as a group is nice in theory, but disastrous in practice.

>I personally react STRONGLY to advocates of "whoever was here first get the
>goodies"! Why? Because it eliminates anything new... it always will. Not just
>packet but just about ANYTHING! The only exception being things that everyone
>sees as beneficial right at the start... and how many things over the years
>have you EVER seen that meet that definition?

That assumes that all the goodies are gone. All the 2-meter pairs may be allocated, but that doesn't include other bands or other parts of the two-meter band. Amateur satellites use up 500 kHz of the 2-meter band. Should this be immune to reuse by earth-to-earth links? Personally, I think so - but why are voice repeaters the only things under attack?

>Not everyone can be a Phil Karn software genius or design and build a AMSAT,
>but I like to think that the vast majority of us SUPPORT those that DO advance
>our hobby through technical achievement. If it means that a sacrifice some-
>times be made... SO BE IT!

Sacrifices are always acceptable to those who are not sacrificed. Tell me honestly: if you had a repeater that you'd put $2000 and a man-year into, would you voluntarily shut it down permanently in the name of technical innovation? Especially if you'd done some innovating yourself on it? The vast majority of amateurs would, to be completely honest, answer "no".

>But it seems that this is not the case anymore. We have legal suits being
>instigated against fellow hams, and we see that there is some really EMPHATIC
>resistance being made to change. Two meter voice repeaters have become almost
>SACRED to a certain faction among us. This makes me a little sick to my
>stomach!

I'm not overly fond of it either, but to think otherwise is to deny reality. We don't live in the best of all possible worlds; we're stuck with the one we have.

>Jay is representing the "keep it as it is" concept and we are pushing the
>"let's develop new things no matter what" concept. I doubt that we will
>ever see eye to eye on this, the differences in beliefs are so fundamental
>as to never be resolved.

"Let's develop new things, no matter what." No matter what other considerations apply. No matter whether or not the program is practical.

I agree that development of new things is a Good Thing. I disagree that it should be allowed to overrule all other considerations.

>Frequency Coordinators make me nervous. Their reason for being was to allow
>growth with less conflict, but now they allow zero growth to avoid conflict.
>We have always had conflict and we have always risen above it in the long
>run, but when the FCC basically gave REGULATORY powers to groups that started
>life as people that were initially only ADVISORARY in nature, they opened
>Pandora's box. Now the ADVISORS are afraid to REGULATE and the users refuse
>to be ADVISED! I can see where "repeater wars" might be better in the LONG
>RUN than what we are faced with now!

Frequency coordinators' regulatory abilities are extremely limited in
nature. You want us to regulate some voice repeaters into unusability,
if not downright legislate them out of existence. We don't have that
power. We cannot order someone off the air.
Growth always has an upper limit. We have reached that limit on one band
in some areas. That does not mean that other bands, or other areas,
have the same problem. I hear lots of calls for technical innovation,
but nobody wants to innovate the use of other bands. Do I detect a
consistency problem here?

>Jay Maynard says that there is nothing that could be worse than repeater
>wars, I say there is one thing that is worse.... stagnation.

We will only stagnate if we allow ourselves to. So far, the only place I
see the possibility occurring is on 2 meters. I see no practical,
implementable alternative, though.

Hi, this is a general plea for help with the Z8530 SCC from Zilog.....

We have built up a small micro based board (6303 + Z8530 + AM7911) to serve as a digi in the locality. The software consists of high-level decoding/monitoring routines which use low-level interrupt driven IO/buffer handlers.

When tested with a commercial TNC on both an audio and digital link the unit functions as expected. However, when used on air it appears that spurious chars creep into the start of each receive frame buffer. Using a buit in debugging tool we have found (as expected) that the additional bytes are due to start-up (TXDELAY) and tail delays on frame transmissions for which the 8530 generates receive interrupts (rightly?). Correctly received frames pass the CRC test, and so the net result is an offset frame in the buffer.

ARE WE MISSING A TRICK WITH THE 8530?

We have presently skirted around the problem for the majority of recevied frames by implementing a high-level 'filter', which recognizes some AX.25 frame charac-teristics. Obviously, this is unsatisfactory and still very much prone to error.

We had also thought about constructing a better carrier detect circuit (tone filter) than the AM7910 provides to reduce the dead carrier time heard by the 8530, but since we know others use the 8530,7911 combination have not done so.

If some kind soul could shed some light on a possible cure, and save us more hours of head scratching and EPROM programming your e-mail would be greatly appreciated......

Thanks in adavnce, Ray Gordon (G1XRN)......

>>"politically impossible" and "value judgments" and his basic emphasis on
>>"he who gets here first gets the goodies and if YOU want some, move to
>>another band".
>
>So far, I haven't seen a different answer that would be perceived as
>fair and equitable.

I don't perceive your answer as "fair and equitable" either.

>Amateur satellites use up 500 kHz of the 2-meter band.
>Should this be immune to reuse by earth-to-earth links? Personally, I
>think so - but why are voice repeaters the only things under attack?

First of all, the amateur satellite allocation on 2m is from 145.8 to
146.0. That's only 200 KHz, not 500 KHz. There are many simplex users
(voice and packet) in the 145.5-145.8 range around here.

Second, I'd like to see how you are going to avoid QRM to satellite
operations (which are inherently weak-signal in nature) from terrestrial
operations. Quite a few satellites are already crowded into this limited
segment. For example, the Microsats will all have their uplinks in the
145.8-146.0 range. Remember that the 2m band in Europe, a very densely
populated continent, is only half as large as ours. Yet this hasn't kept
them from adhering to the international agreement to reserve 145.8-146.0
for satellites. In some cases a few repeaters had to be moved or shut
down, yet, believe it or not, the world didn't end.

>Sacrifices are always acceptable to those who are not sacrificed. Tell
>me honestly: if you had a repeater that you'd put $2000 and a man-year
>into, would you voluntarily shut it down permanently in the name of
>technical innovation? Especially if you'd done some innovating yourself
>on it? The vast majority of amateurs would, to be completely honest,
>answer "no".

In this area several of us have built a functioning 56kbps TCP/IP packet
network on 220.55 MHz. Each modem costs about $500 to build. About half
this cost is attributable to the 28/220 MHz transverter. This investment
would be lost if we are unable to obtain a new allocation above 222 MHz
in the event Docket 87-14 becomes final. Are repeater operators the only
ones whose investments in time and money are to be counted?

Phil

I started working on it, but never got finished, mostly because the priority
to me was too low.

I have the Toshiba databook on my desk for the monster chip in the box. The
bottom line is that the I/O addresses for the SIO are different from a normal
TNC-2, and that you have to program up the CTC clone to do baud rate
generation.

I won't get around to it for a while if ever, my priorities have shifted in
other directions.

/ col:rec.ham-radio.packet / julian@bongo.UUCP (julian macassey) / 8:50 am Apr
24, 1989 /

    I have been able to find out that on Saturday October 7 the 8th annual
ARRL Amateur Radio Computer Networking Conference (what a mouthful) will be
held in Colorado Springs.

So:

Who is hosting it?

Where exactly is it?

Any hotel lists, prices?

    Could someone who is "au fait" please post the exciting details or tell
us where we can find them.

Yours

>I have been able to find out that on Saturday October 7 the 8th annual
>ARRL Amateur Radio Computer Networking Conference (what a mouthful) will
>be held in Colorado Springs.

Yep. At the US Air Force Academy, about 5 miles west of my house... :-)

>Who is hosting it?

TAPR (Tucson Amateur Packet Radio, President N0CCZ and myself as Treasurer both
live in town), RMPRA, the Rocky Mountain Packet Radio Association, and the
Air Force Academy Amateur Radio Club. The work is being done by Andy
Freeborn N0CCZ at the moment.

>Where exactly is it?

The meeting will be held at the Air Force Academy, which is on the west side
of I-25 just north of Colorado Springs. About an hour drive south of Denver.
There will be a semi-organized get-together on Friday night, the program will

run all day Saturday with lunch provided at the Academy, and then there will be an organized get-together on Saturday night.

>Any hotel lists, prices?

Last I heard Andy was working on a conference rate at the brand-new Marriot about 5 miles south of the Academy, which has a pretty awesome view of Pike's Peak and the front range. The rate seemed to be quite reasonable, but I regret that I don't remember it offhand. Will ask Andy. There are also a slew of cheap places on North Academy boulevard, just outside the south entrance to the Academy, across I-25. Lots of decent places to eat for cheap too. Once you've made it to the Springs, this should be a very economical conference to attend...

>Could someone who is "au fait" please post the exciting details or tell
>us where we can find them.

Stay tuned for more info as the event unfolds.

73 - Bdale, N3EUA

ps: I'm open to suggestions for things folks would like to do on Sunday, or is a Sunday organized event even called for? We've got a couple of things like NORAD and the Space Command here in town, don't know what would be interesting...

Has anybody tried to copy rtty using a Sony ICF2010 and
a PK232. I have been trying to do this to no avail. I am
simplifying things by trying to copy the ARRL's daily rtty
news bulletins since I know the mode and speed, and I receive them
clearly. I have managed to copy MORSE but after I adjusted
the speed my self to 20 WPM (The manual claims that the PK232
is able to adjust the speed automatically). But I have not been able

at all to copy rtty signals (either BAUOT, AMTOR, or ASCII).
As a matter of fact, I have not been able to copy Packet either, but
I am assuming that that needs a better HF receiver. If someone has tried
this copying with this setup, or a similar one, with success, I would
greatly appreciate their advice.

Agreed. I would suggest that something like "Amateur Digital Systems
Conference" would be more appropriate. This covers the majority of the
current and future work under one umbrella.

I've been toying with some ideas for a voice mail interface, perhaps using

Phil's package for the transfer (there exists a voice mail protocol, though it is old and pretty much outdated). In a PC-based system, it wouldn't take much to set up a rudimentary VM interface. A DAC/ADC pair with a little analog glue on a board is all that is really necessary. The interface would be a microphone and speaker for I/O, with the software interface being a simple VM browser, allowing the user to 'read' mail and queue messages for delivery to other amateurs. The NET package would do the delivery, though ideally a new protocol would be implemented so that true binary transfers could take place (skipping the binary-to-ascii conversion and allowing data compression and perhaps (maybe someday) encryption). As an alternative to having the PC spoon feed the DAC/ADC pair, a Motorola 56K can be placed on the board to do all the work (and in its spare time it can be used as a modem or image processor).

Along the same lines, we have the potential to do some really exciting things with imaging, using amateur digital communications as the transport medium. Besides the obvious uses of `picture mail' and other one-shot style image exchange, we can start using amateur radio to do `real work'. Images from space can be downloaded from satellites for image processing and display on the user's screen (one of the AMSAT/TAPR microsats will apparently have this capability). The CCD-array observatory down the road can be controlled remotely via packet radio, with the scanned images transferred and displayed at one or more locations in the area. Here amateur radio becomes more of a tool for other hobbies rather than the main hobby of interest.

The hardware to do these kinds of tasks (reasonable compute power, usable monitor resolutions, etc.) is available today. Of course, to reduce the data transfer times down to a reasonable level, high-speed modems are the hardware of choice, with much work to be done to make them available cheaply.

I don't think we should limit ourselves to just "Gee, Bob, I lost another tooth today..." type communications (as we see often in packet radio). There are a lot of other exciting things we can do with our hobby, perhaps attracting new, interesting people to the hobby in the process.

What's NeXT using? Their machines come with a nifty voice mail, that is
somehow glued to regular Unix mail. I had one for a few days, and did 'od -x'
on some mail enough to see there was a jumble of binary data.

I'm all for stealing, er, ah, *reusing* things others have worked the bugs out
of, rather than rolling my own.

Files are located under pub/TPRS

Texas Packet Radio Society, Inc.

TPRS was founded in 1985 as an educational, public service, and scientific research non-profit corporation. The primary goal of the Texas Packet Radio Society is to design and research amateur radio packet networks. In 1987, the Texas VHF-FM Society commissioned the TPRS to coordinate digital communication networks within the state of Texas. Both organizations have recognized the need for reliable network systems to handle large volumes of packet radio traffic efficiently.

TPRS has organizing state-wide working groups to cover various networking topics. New groups are planned to form as needed to provide channels for discussion and to help provide direction for that area of digital communications. The current working groups are the Texas Network Group, the Mailbox/BBS Group, and the TexNet Support Groups (Software and Hardware). TPRS hopes that these working groups will help promote packet in Texas.

TEXNET
TPRS has been establishing a digital packet network protocol, a standard hardware package for the network nodes, and conducting on-the-air tests of the software modules that implement the TexNet network.

The basic design philosophy of TexNet is of an open, inexpensive, multi-resource, high speed "backbone" with access through multi-connect capable local nodes. On the high speed side, TexNet is a 9600 baud network system. For local access, compatibility with the typical 2 meter AX.25, 1200 baud, AFSK/FM station is the operational norm. Other baud rates and modulation techniques can be supported on the primary user port or a secondary port. The system is totally compatible with both versions

of the AX.25 protocol specifications for user connections. With these general specifications, TexNet has been designed and tested to enable all users to take advantage of this high speed, full protocol protected packet network system.

Each node offers, in addition to TexNet access, local area digipeater service, 2 conference bridges for full protocol protected roundtable or net operation, a full multi-connect, multi-user mailbox system, a local console for installation and maintenance setups, a debugger module for long distance and local software monitoring, and a weather information server for the regional weather teletype wire loop.

The TexNet network system has been operational since October 1986. Use of the TexNet system is open to all amateur operators. TPRS has been coordinating the installation of the Texas TexNet system. Currently the network runs from Dallas to Rockport on the gluf. TexNet boards have been distributed to California, Michigan, Oklahoma, OPhio, Indiana, Alaska, Belgium, and Japan. Network nodes have been built primarily by local groups. Further expansion of the system depends entirely upon the amateur radio community.

INFORMATION
TPRS is interested in spreading our information and research efforts as widely as possible. We want other groups involved with network efforts to get in contact with us. We will provide information for those amateur packet groups that are interested in this system for their areas. In addition, TPRS has been raising its level of general packet information to help support packet radio operators in general within Texas. If you would like more information concerning TPRS or TexNet, please drop a letter to :

Texas Packet Radio Society, Inc.
P.O. Box 831566
Richardson, Texas 75083

TPRS MEMBERSHIP
TPRS membership is widespread with most members located in Texas, but a few members are located in other states and in DX locations. Membership is open to any interested person.

If you are interested in becoming a member and receiving the TPRS Quarterly Report, please send your name, address and call to the address above and we will send you the necessary information.

Texas Packet Radio Society
TexNet User's Manual 3.5 Summary
August 1, 1988
Greg Jones, WD5IVD

==========

Introduction :
TexNet is a dedicated, remote sited, multi-access, multi-resource network system. Each node offers, in addition to TexNet access, several network services which are descirbed below. Use of any of the node services is selected by Secondary Station Identification numbers (SSID). TexNet is open to all amateur radio operators to use.

TexNet Node Services :
Each service is connected to by using an ssid. Example : c WR5C-4 will connect the user to the DALLAS TexNet node on 145.05 in Plano, Texas.

0 - Digipeater Operation
All TexNet nodes can be used as digipeaters.
The nodes call or alias can be used to digipeat through.
Use of a node as a wide area digipeater is not encouraged.

2 & 3 - Conference Bridge
Each node maintains 2 conference bridges (ssid 2 & 3).
Once connected all transmitted packets are sent to all other users connected to the conference bridge, providing roundtable communications.
Control-U will list all other users connected to your bridge.

4 - TexNet Network
The TexNet network is made up of a network of nodes connected by 450Mhz 9600 baud links (backbone). The following is a description of the current network commands. Commands are entered at the command prompt : NETWORK CMD?.

Help or ?
Returns a listing of the user commands.

Bye or b
At the NETWORK CMD ? prompt will disconnect you from the network.

Location or L
Returns a listing of all nodes on the network by name.

Message @ NODE or M @ NODE
Make a connection to a message server (PMS) @ NODE.
PMS commands are a subset of the W0RLI BBS command set.
PMS Commands : Bye, List, Kill, Read, Send (B,L,K,R,S)
[Example: M @ DALLAS]

Weather or W
Make a connection to the network weather server.
LW lists the general weather statements.
LS lists the server weather statements.

Circuit or C
Circuit allows a user at one node to make a connection to a user at another node over the network. Example : C K5ABC @ HOUSTON would allow a user to try to connect to K5ABC at the Houston node over the network.

C CQ @ NODE
Transmits a CQ using your call at the node indicated.
To respond to a CQ call, just connect to the network and then type 'C CALL @ NODE'. The network should handle the rest. To finish a QSO, one user must do a manual disconnect

from the TNC cmd: prompt.

General :
The TexNet User's Manual contains a full description of the TexNet
node services and network commands.

Dear all,
Can anybody give me reviews of the Kantronics KAM, the AEA PK-232, and
the MFJ MFJ-1278? I am considering buying one of these. I want a TNC
that handles not only HF packet, but also RTTY, AMTOR, and CW. I have
heard negative reviews about the KAM; is this a wide-spread opinion?
Also, do I really need the optional software packages to use these TNCs?
I have a non-IBM compatible machine (the NEC PC-9801uv2, in case you
heard about it), which precludes me from using such software. I noticed
some reviews on this bboard a while back -- unfortunately, my site
purged those files, and I cannot retrieve them.

Thanks,
>goh< (kawai@csli.stanford.edu [arpanet])(n6uok)

->
->Has anybody tried to copy rtty using a Sony ICF2010 and
->a PK232. I have been trying to do this to no avail. I am
->simplifying things by trying to copy the ARRL's daily rtty
->news bulletins since I know the mode and speed, and I receive them
Well, I have a (still broken) PK-232 and (used to) have a 2010, and
I had some success copying RTTY, although not much more than you.
One you might try copying is Prensa Latina in Havana on 18192.5kHz,
which runs an English news bulletin at 2000UTC every day. To
try to get it, you might try using WIDESHIFT ON, and use the
SIGNAL mode (it's described in Appendix N in my edition of the
manual).

->clearly. I have managed to copy MORSE but after I adjusted
->the speed my self to 20 WPM (The manual claims that the PK232
->is able to adjust the speed automatically). But I have not been able
->at all to copy rtty signals (either BAUOT, AMTOR, or ASCII).
I didn't have much trouble in copying CW; when you get the signal tuned
properly, use the LOCK command to get the PK-232 on the right speed..

->As a matter of fact, I have not been able to copy Packet either, but
->I am assuming that that needs a better HF receiver. If someone has tried
->this copying with this setup, or a similar one, with success, I would
->greatly appreciate their advice.
I didn't try copying HF packet, but I did successfully get it to work
using a hand-held scanner...

I hope this helps some.

In PACKET-RADIO Digest V89 #117, Jay Maynard writes:

>Recoordinating a repeater should be a fairly simple process. The red
>tape involved is no more intricate than a new coordination.

Yes, it shouldn't be that bad. This particular situation was the
first time I had personally ever dealt with a frequency coordinator.
Possibly it left a bad taste in my mouth because the lawsuit in
Dallas was in progress, and I felt like nothing could be done.

There are some things I would like to tell you concerning how viewpoints
towards the coordination process were developed by users of the local
repeater. The image perceived may or may not have complete facts to back it
up, so I will send mail to you directly. Maybe we can improve the
coordination process. I am as interested in improving the procedure, as
I am in fixing this particular problem.

Hi everybody.

I am an amature to the amature radio. Over past few weeks say(5-6) I was
regularly reading, rec.ham-radio and rec.ham-radio.packet. Things appeard
were remarkable, and grate, despite the problem that I know nothing about
that. But I would like to carry on, because it is fasinating. But some
wizard(s) may like to help me or possibly quite a lot of people like me.
The area which I am particularly interested is in radio packet switching.
There were quite a few terms which I collected over past few weeks, that
I don't understand is :

BAOUT
AMTOR
KISS
TNC
PK232
....
,.....

list is longer but I suppose this would say someting about my knowledge. :-)
I would like somebody write brief introdcuction to this group about this
and possibly how to start up. In otherwords what I am asking may be
how to start up as an amature. Most possibly these questions have been
asked sevaral times in the past. I would be most grateful for some overviews
and possibly pointers to good startup books and start-up kits. etc. etc.

Thanks for your patience.

Athula.

The latest release of the Macintosh version of the KA9Q TCP/IP package is now available for anonymous FTP from flash.bellcore.com (128.96.32.20).

There are four files: source code and executable program each for NET and BM. The files are in Stuffit 1.5.1 binary format. They are also BinHexed, so you'll have to unBinHex them before you unStuff them.

This is the version we distributed at Dayton. Its official name is 871225.33a4 Macintosh version 1.0.

Any questions about the files themselves, please contact Doug Thom (thom@apple.com) or Mike Chepponis (k3mc@apple.com). I hope that various people will download the files to BBSs and such to make them available to those who don't have direct Internet access. Two Bay Area BBSs that have the current object files are MacScience at (408) 866-4933, and Digikron Systems (Doug's machine) at (408) 253-1309.

I have an AEA PK-232. It's fairly good for Packet, RTTY, and AMTOR. I don't do much HF Packet, but use it fairly heavily for VHF Packet and RTTY/AMTOR. I also have the PC Packratt software with it, which is convenient, but has a handful of really annoying bugs. The FAX mode is a joke, it's not much use except for making illegible copies of weather maps.

#Hi Detlef - you should be receiving some files concerning TexNet
#via your BITNET account, but for the rest of the folks out there
#in net land - here is what I sent.
#
#Hope the info helps --- greg

Greg,
     I too appreciate your posting the TEXnet info. However,
it just whets the appetite (among us techies) for more dope!

     Can you (or somebody) summarize for us what TEXnet uses
for protocols? In particular, how does it do wide-area stuff? Is
it like X.25 PLP (CONS, like ROSE), or is it like NET/ROM, like
IP, or homegrown?

     Enquiring minds want to know. Thanx,
          fred k1io

re:3 May 89 16:38:06 GMT
From: shelby!csli!kawai@decwrl.dec.com (Goh Kawai)
Subject: TNC reviews - info request

Dear all,
Can anybody give me reviews of the Kantronics KAM, the AEA PK-232, and
the MFJ MFJ-1278?

YOUR QUESTION IS SOMEWHAT SUBJECTIVE AS WILL BE THE REPLY. I PERSONALLY USE A PK-232 AND LOCAL PACKETEERS ARE USING KAM, AND MFJ. I WILL COMMENT ON MY EXPERIENCES AND RELATE THEIR COMMENTS.

YOU DO NOT NEED THE OPTIONAL SOFTWARE TO USE ANY OF THESE UNITS. THEY ALL OPERATE EQUALLY WELL FROM A DUMB ASCII TERMINAL OR VIA ANY TERMINAL EMULATOR PACKAGE RUNNING ON A MICROPROCESSOR - EXCEPT FOR FAX MODE. THE ASSOCIATED SOFTWARE PACKAGES DO MAKE SOME OF THE COMMUNICATIONS MODES EASIER TO USE AND PROVIDE MORE PLEASANT DISPLAYS - LIKE A SPLIT SCREEN FOR TRANSMIT BUFFER AND RECEIVE BUFFER IN PACKET MODE. THERE IS A FAIR AMOUNT OF SHAREWARE AROUND ON BBS' THAT DO MUCH OF THE SAME.
 FOR FAX MODE, THE FAX SOFTWARE (PK-FAX) ALLOWS VIEWING FAX PICTURES ON THE CRT AND STORING THEM ON THE DISK , PRINTING, ETC. LACKING THE SOFTWARE, THE PK-232 CAN PRINT THE FAX PICTURE DIRECTLY TO A CENTRONICS PARALLEL INTERFACE COMPATIBLE PRINTER.

I HAVE USED MY PK-232 IN ALL MODES - PACKET (VHF & HF), AMTOR, RTTY, FAX, AND CW. IT PERFORMS AS ADVERTISED AND HAS MET ALL MY EXPECTATIONS.   THE PK-232 HAS A NICE FEATURE WHERE IT MONITORS A SIGNAL AND THEN GUESSES WHAT IT IS - BAUDOT, ASCII, AMTOR, ETC.   WHEN IT DISPLAYS A PROBABILITY FACTOR ABOVE 70%, IT IS ALMOST ALWAYS CORRECT.

THE SECRET TO SUCCESS WITH THE PK-232 WAS LEARNING TO TUNE THE SIGNALS CORRECTLY. THE MULTI-LED DISPLAY IS ADEQUATE ONCE YOU KNOW WHAT YOU ARE DOING BUT A 'SCOPE (CONNECTOR PROVIDED) WOULD BE MUCH BETTER FOR THE BEGINNER.

 STATIC CRASHES AND QRM ARE ANATHEMA TO CW - WEAK SIGNAL PERFORMANCE IS POOR. WITH GOOD SIGNALS, CW COPY IS EXCELLENT - DEPENDING UPON THE FIST OF THE SENDER. RUN-TOGETHER CHARACTERS ARE INTERPRETED AS "?" OR "_" SYMBOLS. IT IS A GOOD TEST OF CW SENDING SKILLS TO HAVE THE PK-232 MONITOR YOUR FIST!

THE UNIT DOES WHAT IT IS ADVERTISED TO DO. THE PK-232'S LED DISPLAY IS VERY HANDY IN DETERMINING WHAT IS GOING ON, THE KAM AND MFJ UNITS TEND TO BE SPARSE IN THE REGARD.

SOME OF THE PK-232 DEFICIENCIES I HAVE HEARD ABOUT BUT NOT EXPERIENCED: RFI ; INADEQUATE PROTECTION ON THE 12VDC INPUT LEAD (NO REVERSE POLARITY OR SPIKE PROTECTION).; BATTERIES FALLING OUT OF THE INTERNAL HOLDER [MOUNTED IN THE LID] . SIMPLE MODS EXIST TO CORRECT ALL THESE PROBLEMS.

WHAT I HAVE HEARD ABOUT KANTRONICS AND MFJ GEAR IS UNSUBSTANTIATED HEAR-SAY, SO I WILL NOT REPEAT IT HERE.
ONE FEATURE OF THE KAM I DO LIKE IS THE DUAL MODEM / DUAL CHANNEL CAPABILITY WHICH PERMITS SIMULTANEOUS HF/VHF PACKET OPERATION. THE PK-232 CAN DO ONE OR THE OTHER BUT NOT BOTH CONCURRENTLY. IF YOU PLAN OPERATIONS AS A GATEWAY BETWEEN HF AND VHF PACKET, THIS MIGHT IINTEREST YOU.

FROM PERSONAL EXPERIENCE, IF I WERE IN THE MARKET AGAIN, I WOULD CONSIDER EITHER THE PK-232 OR THE KAM TO BE EQUAL CONTENDERS WITH THE DECISION RESTING UPON FACTORS LIKE THE KAM'S DUAL CHANNEL CAPABILITY AND MY NEED FOR THAT FEATURE. I WOULD AVOID MFJ - WHICH ONE DEALER DESCRIBED AS "My Friend's Junk" . MY EXPERIENCE WITH MFJ PURCHASES HAVE BEEN CONSISTENT WITH THAT DESCRIPTION. MFJ'S LOWER PRICES ARA ACHIEVED THROUGH QUALITY TRADE-OFFS. 73, WAYNE, KB6CSP

It turns out, one of the local packeteers, in a message about something else, told me that the Japanese version of the Heath Pocket Packet already has KISS built in, and he's got a copy. As soon as I can get together with him, I'll have it. Now, to get the keyboard on my Portable Plus repaired.

>To me, one thing that comes across very clearly from this discussion
>is that Mr. Maynard has no solution to this problem. If this is an
>important enough problem, I would encourage him to resign and let
>someone else deal with it.

I said that I didn't have the solution at the very beginning.
I do, however, have the desire and the willingness to work on a
solution. So far, I have seen few others who are actively working in the
coordination process. I put my time and energy where my mouth is.

Lots of other people hold offices where they don't have answers, but are
working on them. Would you turn them out as well? Better start with
Congress, your state legislature,...

>Another thing that I get out of this discussion, is that any "value
>judgements" that are employed must not be that of one or two
>individuals, but of the whole group in the frequency coordinated area.
>(Remember the language in the announcement where the FCC recognized
>frequency coordinators that they derive their "authority" by consent
>of the people that they are coordinating).

This is the only way I see out of this. The ham population at large has
told us that they perceive the present system is the only fair,
equitable way to get there from here. If the ham population tells us
differently, then maybe we have a solution. I can only speak for Texas,
but the Texas VHF-FM Society is a membership organization open to all
hams. I invite anyone who thinks our priorities to come to the next
Society board meeting, athe ARRL National in June, and tell us all about
it. It would help if you had specific ideas for a change.

>I think that there is indeed a political solution to the repeater
>usage problem. Those who do not like it should band together and call
>for a special election. Then make it an issue in the election of
>whether or not perpetual frequency assignments for repeaters or other
>users will be supported by the ham public. This may end up voting
>the current frequency coordinators out of office. More importantly,
>it makes the issue one of public debate amoung the whole group, and it
>may be politically possible then to follow through with whatever the
>outcome is.

No special election is necessary, at least in Texas. The Board is

elected for two-year terms, half every other year, and any ham can join the Society and run. Further, any Society policy can be (and often is) changed at the general membership meeting. The next membership meeting will be in Austin, the first weekend in August.

>However, an election is a two-edged sword. Those people who will want
>to keep their allocations will probably be very interested in
>retaining the status-quo with "educating" the users of their repeaters
>about their own point of view. So be prepared to do your own
>"education", persuasion, or whatever. And the repeater users may end
>up out voting you. If this happens, you can simply do more
>education, and try again later.

An enlightened approach; remember, though, that elections reflect the will of the people who are interested enough to vote. "Education" (or, more honestly, politicking) may or may not help. Remember also that a loss may not mean that you haven't educated everyone enough; there's also the (strong) possibility that the result reflects what the ham community really wants.

>To the best of my knowledge, the FCC did not make a frequency
>coordinator's tenure permanent. I did not recall a specific
>procedure set up by which one recognizes a new one, though.

There is no procedure by which a coordinator is recognized, period. The recent mess in Southern California on 220 shows what happens when someone doesn't work within the system: chaos ensues.
The Texas VHF-FM Society has been defacto recognized as the coordination body for Texas primarily because we've been doing it for 25 years, and nobody else has. By now, we've earned the respect of the general Texas ham public.

Hello,

It has been a while since I have posted this information, and with the NEW release of the KA9Q TCP/IP Software I felt I should probably do it again! Here is the information on how to retreive the latest bits from the WB3FFV telephone based bulletin board. PLEASE don't leave me a ton of Email, as I don't have much time to reply...

+---+

HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the Amateur Community (but there is other stuff on-line). As of now I have not attempted to promote this system any place except in the amateur channels (PACKET, USENET, & word of mouth), and will continue under this policy, as I hope to keep it oriented toward amateur radio. The various software for UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through user support I hope to keep the latest and greatest ham software on-line. Below is the information that is needed in order to access the BBS via Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
Login: bbs
Number: (301)-335-0858 -- 1200 & 2400 (Non-MNP)
Number: (301)-335-1955 -- 2400 (MNP), 9600 & 19200 (PEP)
Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS)
IP Address: 44.60.0.1 {wb3ffv.ampr.org} [for FTP access on 145.550 mhz ONLY]
Misc. Info: Machine is an 80386 computer running UNIX V.3.2 and features 300+ meg of on-line storage. Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage all to upload anything new that they come up with, as it is of benefit to all. Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.12)
W0RLI BBS for the PC (Versions 6.xx, 7.xx, 8.xx, 9.xx)
Various BBS utilities and enhancements
Several MORSE CODE Tutors

TheNet software by NORD><LINK (Version 1.01)
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

For anybody that desires to use UUCP for file transfer, use a login of uucpanon and no password!

P.S. - This system will be kept current within several days when it comes to the TCP/IP software, as I am trying my best to promote IP in the PACKET community...

>>So far, I haven't seen a different answer that would be perceived as
>>fair and equitable.
>I don't perceive your answer as "fair and equitable" either.

You're in the tiny minority. I do have to consider the larger ham
community, and they've told us that they do perceive it that way.

>First of all, the amateur satellite allocation on 2m is from 145.8 to
>146.0. That's only 200 KHz, not 500 KHz. There are many simplex users
>(voice and packet) in the 145.5-145.8 range around here.

Wanna use that space for repeaters? Go talk to the FCC, not me.
There has been some complaining, though - even before the shuttle
flights with hams aboard - about terrestrial FM simplex on 145.555 in
particular, and the reason given was that it interfered with satellite
use.

>Remember that the 2m band in Europe, a very densely
>populated continent, is only half as large as ours. Yet this hasn't kept
>them from adhering to the international agreement to reserve 145.8-146.0
>for satellites. In some cases a few repeaters had to be moved or shut
>down, yet, believe it or not, the world didn't end.

Europe is different. They have very tightly controlled repeater
allocations - the government does it, and the government can tell them
to shut down a repeater and make it stick. We can't. Their repeaters are
also run, not by individuals, but by (large) ham clubs.

>In this area several of us have built a functioning 56kbps TCP/IP packet
>network on 220.55 MHz. Each modem costs about $500 to build. About half
>this cost is attributable to the 28/220 MHz transverter. This investment
>would be lost if we are unable to obtain a new allocation above 222 MHz
>in the event Docket 87-14 becomes final. Are repeater operators the only
>ones whose investments in time and money are to be counted?

I've said before that 220 is a special case: the FCC's grab makes it
obvious to repeater trustees that they will have to move. The band's
also not so full that there's no place for them to move to. Neither
condition exists on 2 meters.
Have you forgotten that I'm doing my best to see that packet gets half
of whatever spectrum is freed up by moving repeaters?

>You're in the tiny minority. I do have to consider the larger ham
>community, and they've told us that they do perceive it that way.

The minority of what? If you only canvass the existing repeater owners (which dominiate every frequency coordinating body I've ever seen -- which is why they're usually called "repeater councils") of COURSE you will find that most want to preserve the status quo.

>Wanna use that space for repeaters? [145.5-145.8] Go talk to the FCC, not me.

What gave you this idea? We already have plenty of space, perhaps too much space, on 2m that is occupied by repeaters. There needs to be room for other modes, e.g., FM simplex, SSB and weak signal work, packet, satellite and so on. The reason we still have repeater subbands on 2m even in this era of deregulation is recognition by the FCC that without subbands, FM repeaters would immediately swallow up the entire band.

>There has been some complaining, though - even before the shuttle
>flights with hams aboard - about terrestrial FM simplex on 145.555 in
>particular, and the reason given was that it interfered with satellite
>use.

This is news to me. A check of my references shows that EVERY unmanned amateur satellite -- with one exception -- from Oscar-6 to the present that uses 2m does (or did) so in the 145.8-146.0 segment. (The one exception is Oscar-13, whose mode J uplink listens between 144.425 and 144.475 MHz.) Even the Russian RS satellites follow this convention. The *only* space operation I know of on 145.55 MHz has been the US and Soviet 'ham-in-space' flights. Being more like DX-peditions than anything else, these are obviously in a special category.

>Europe is different. They have very tightly controlled repeater
>allocations - the government does it, and the government can tell them
>to shut down a repeater and make it stick. We can't. Their repeaters are
>also run, not by individuals, but by (large) ham clubs.

Sigh. Remember the Prose Walker days of the early 1970s? I much prefer the way things are now, with the hams regulating themselves, even if it's a little anarchic at times. The problem is, our much-touted self-regulation seems to be largely a paper tiger, which is why we still have things like repeater subbands. I wish hams understood that it's always better to be

able to regulate yourself than to have the government do it for you.

>I've said before that 220 is a special case: the FCC's grab makes it
>obvious to repeater trustees that they will have to move. The band's

Halllujah! Now we're getting somewhere. Can you please tell this to the
local TSARC people?

Phil

OK - maybe this is just me being stupid, or showing my ignorance.

But I have been trying to get the KA9Q software going on a Sun 2,
without much luck so far. But in any case it seems to me that
it is not exactly what I want.

It may not be the best machine in the world, but the Sun 2 comes
with support for TCP/IP and other networking tools emulated (OK
implemented) in KA9Q net such as smtp etc etc.

Therefore I think the ideal solution for me would be an AX25
driver for the serial line that could be ifconfig'd to listen to
and talk on the 44.131 network.

Question is - has anybody done it already?

If not - does anyone have a good idea on where to start, would
it be possible for instance to alter the SLIP code to suit this
application?

Please forgive me if this is the wrong thing to ask, or if the
answer is so painfully obvious that I should have known it
already, but I am new to this game (my callsign will tell you
that), I am also keen to learn though.

In article <8792@csli.Stanford.EDU> you write:
>Dear all,
>Can anybody give me reviews of the Kantronics KAM, the AEA PK-232, and
>the MFJ MFJ-1278? I am considering buying one of these. I want a TNC

I have owned the MFJ-1278 for about a yesr now, and am really pleased with it.
I had also consodered the PK-232, but chose the MFJ over it for a couple of
reasons:

> First, the MFJ was about $40 cheaper at the time. Both units have
> similar features, so this really helped.
>
> Also, the MFJ is much smaller than the PK-232. In a crowded shack,
> this was a plus for me.

> is in.

Anyhow, about the software -- any communications software, such as you would use with a modem, will work fine for the 'pure digital' modes, but to display FAX, SSTV, etc. on your screen, you will have to use their software on a PC compatable. (With the MFJ, though, you can plug in any EPSON compatable graphics printer, and print out FAX and SSTV reguardless of what computer you have!)

Jon

    Here we go again! Europe is different. Yes, it is different, they find they can live without a repeater on every channel. I know of several repeaters in EU run by individuals, and some run be clubs. Mr Maynard has already admitted he knows nothing about EU VHF conditions, why oh why does he then persist on telling us that things are different over there. The only difference is that there seems to be more attention paid to uses other than personal repeaters over there. There are no private repeaters over there and the VHF bands have not been monopolised by repeater barons serving their own agenda.

    Do I have to present my antecedents here so Mr Maynard will nopt come back yet again and tell me I don't understand? Would the fact that I used to be on a Region 1 VHF sub committee help? Please, please lets hear no more about the chaos of US bands being because: We can't change anything. You don't understand. It's different over there.

Yours

Although I am not the "wizard" that you are probably looking for, I
will volunteer an answer here because I asked a similar question last
year. What you are looking for is an introduction to packet radio. This
can best be done by picking up a book on packet. (I wouldn't say
a magazine article, as magazines usually assume that you know something,
whereas books invariably start from scratch). One such book is:

Digital Communications with Amateur Radio
by Jim Grubbs, k9ei

which is published by Radio Shack, and sells for only $7. This is
an elementary book which gives you the basics you need to be able
to understand magazine articles on packet, or discussions going on
among 'packeteers'.

As to the list you have above, I think you took the word BAOUT from
a message I posted last week. I am afraid, this was a typo, where
the actual word is BAUDOT (a digital transimission mode, where every
character is coded as 5 bits).

>......

Now to the rest of the net, I have these questions:

Where can I find info on AMPRnet? (Magazine article, electronic files,
BBS, ftp...etc) Or if someone can write a few paragraphs about it
it would be appreciated (mainly its current extent, how a station can be
a node on it, who administers it, gateways, if any, to land
networks, such as the Internet, uucp, fidonet, ... etc.)?

Thanks in advance.

"The only stupid question is the one that is never asked."

I have see a few questions about the differences betweent the Kantronix
KAM and the AEA PK-232.

I own a KAM, and have not had (before now) the chance to compare the KAM
and PK-232 together. I am very happy with the KAM. Others (the infamous
"THEY"), have said that the PK-232 is better on HF modes than the KAM, but
the KAM is better at packet (and it gateways between HF and VHF packet).
I have always taken this as a possibility, but have not had the chance to
compare, side-by-side, the KAM and the PK-232.

The next part of this story is as follows: I happend to be at a friend's
house (Doug, N1FUB), who had recently acquired a PK-233 in a package deal
with some equipment that he purchased. He already owned a KAM. This set
the stage for the test that I have been meaning to do... compare the
two under identical conditions.

I am sorry to report that the test FAILED misserably!!! (SP?) The PK-232
put out SO MUCH RFI (noise!) that we couln't hear any signals unless they
were stronger than S9 (much stronger!)... Yes, the cables were all shielded
and grounds were in place. The KAM didn't put out any detectable noise.
His computer (a IBM-AT) did put small amount of noise on various frequencies.

So this test will have to be conducted at a later date.... when we get the
PK-232 to be quieter....

Note: The receiving antenna was close the the "shack"... and may account
for the STRONG pick-up of the noise.   OR maybe the PK-232 is sick in some
way... We hope to continue this test. Maybe at my shack where the antennas
are at least 60 feet from the shack.

                    Rich, NM1D

The issues in a past posting here, and in a recent (June!) article in 73
Magazine about the alleged theft of Net/ROM code in TheNet has got me to
thinking again about these issues.

First of all, The FCC has nothing to do whatsoever with software piracy.
Anyone who wants the FCC to do something about it should go read the
Communications Act and see if they can find anything in there about it.
I can save you some time and tell you it isn't in there. Software
piracy just is not a communications issue; it's one of commerce, and
international in this case.

Reverse engineering is in fact quite commonplace. I suspect that many of
the mods to our computer controlled radios are determined by reverse
engineering since the manufacturers do not admit to them in many cases.
Of course some of this could just be leaks from inside the companies.

Reverse engineering is still commonplace in the entire electronics and
computer industry. The clone makers do it to see what is REALLY going on
since it is almost impossible to build a clone from specs alone the first
time around due to the poor quality of those specs. IBM has no burning
need to make the specs so thorough that anyone can duplicate their machines.

Reverse engineering of software is even more commonplace than for hardware
just because the specs here are so vague. Anyone who does this, though,
has to be extra careful not to let the original code slip into the clone
product. Apparently, the makers of TheNet messed up on this one, or else
hoped that no one would notice.

One thing I do wonder about is how good the specs are, and if they are even
available to anyone who wants them. Take for example the TNC-2 that Net/ROM

and TheNet were designed for. Are there a set of specs that do in fact tell you all that you need to know about the hardware so that you could write software for it? Are they available to anyone who wants them? Would TAPR be willing to give them out for copying costs, sell them, or are they just wanting to keep them as a trade secret (and a challenge to hackers)?

Also, would the make of Net/ROM be equally as willing to reveal the protocol details about how Net/ROM nodes talk to each other (what goes over the air) so that a truly legitimate original effect at cloning Net/ROM would be at the least, compatible with Net/ROM as a network component?

I'm not sure who to contact about getting the above information, so I have not yet actually tried. This information is clearly NOT as readily available as DDN/Internet protocols are, nor are they as readily available as mods to popular Japanese radios.

Can someone supply some information about the availability of this information? I want to continue the ham spirit of home-brew and building, but in the software context.

I am a programmer, not an electrical engineer, so my construction tools are assemblers, compilers, editors, and loaders. Hardware is still needed.
I see no reason that there cannot be hardware sold commercially that can be the base for a programming effort, and not be a full blown PC with a ton of added cards. What I would like to see is for the manufacturer of each kind of equipment for amateur radio that uses a processor (TNC's, HT's, base rigs, mobile rigs, and even repeater controllers) to supply clear and complete programming specs for their hardware so that the software hams among us all have a chance to program the hardware to do the things we want (and think of).

Let's have some innovation on the software side as well. Net/ROM was just a start.

There is a clear distinction between the functions of a repeater coordinating group, and a spectrum planning group. The spectrum planning function needs to consider all uses of radio spectrum. I hear (although do not agree with) the arguments that only repeater owners should determine the policies for repeater coordinators. However, when a group such as Illinois Repeater Association is starting to do spectrum planning, and still only allows the owners of repeaters to have voting membership, then I something is seriously wrong. What it may be is simply the vacuum of no one else doing the spectrum planning function. At this point I am going to be looking into the creation of a new organization, probably to be called the Illinois Spectrum Planning Association, which would be open to all licensed amateurs residing in the state. Then the issues of packet vs. repeaters vs. ATV vs. satellites vs. spread spectrum vs. whatever-else-comes-along-next can be equally and fairly discussed and resolved.

That will still leave open the problems of repeaters being spectrum hogs by not making an effort to tighten up their spacings, use PL and anti-PL, and not consider every case of overlap as interference. It still does not solve the problem of the repeater owners ganging together for little more than to protect their turf. I believe the FCC's decision to not recognize official coordinators is correct. Anyone CAN be a coordinator. I am still thinking about it.

Hello All,

I sent out a message the other day telling people how to get the latest bits (KA9Q release 890421.0) from my BBS, and mentioned that anyone interested could use anonymous UUCP to access the files. What I forgot was to tell everybody how to find the information on the files you desire

to retrieve. Well here one more time is the listing, and hopefully with
enough information to allow anybody access that desires the information...

+--+

HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the Amateur Community (but there is other stuff on-line). As of now I have not attempted to promote this system any place except in the amateur channels (PACKET, USENET, & word of mouth), and will continue under this policy, as I hope to keep it oriented toward amateur radio. The various software for UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through user support I hope to keep the latest and greatest ham software on-line. Below is the information that is needed in order to access the BBS via Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
Login: bbs
Number: (301)-335-0858 -- 1200 & 2400 (Non-MNP)
Number: (301)-335-1955 -- 2400 (MNP), 9600 & 19200 (PEP)
Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS)
IP Address: 44.60.0.1 {wb3ffv.ampr.org} [for FTP access on 145.550 mhz ONLY]
Misc. Info: Machine is an 80386 computer running UNIX V.3.2 and features 300+ meg of on-line storage. Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage all to upload anything new that they come up with, as it is of benefit to all. Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.12)
W0RLI BBS for the PC (Versions 6.xx, 7.xx, 8.xx, 9.xx)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01)
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

For anybody that desires to use UUCP for file transfer, use a login of uucpanon and no password! Also to obtain a listing of the files that are avalible for UUCP transfer, request a file called FILES in the directory /usr/spool/uucppublic.

P.S. - This system will be kept current within several days when it comes to the TCP/IP software, as I am trying my best to promote IP in the PACKET community...

Am I glad to see this, not because I hate AEA or love Kantronics. In fact right now, I don't own equipment made by either company. My bone of contention is RFI generated by "Ham Equipment". When my Toshiba T1100P laptop spews out junk that interferes with my FM BC reception and clobbers my walkie talkie, I can't say too much. Sure the equipment is supposed to pass FCC Part 15 Subpart J, Class B. But just what does it mean?

As many readers can tell you, and many also have done. You can make any piece of equipment with Microprocessors in it RF quiet. Manufacturers can too. In fact it is easier for them. They can do it in production, cheaply, and easily. If they follow a few simple rules they can make quiet equipment.

The sad truth alas is that they don't design equipment to be quiet. What do they care if it radiates? Not a whit until they take the pilot production stuff into the FCC lab and it radiates like a hooker at a sales meeting. At this point, panic stricken, they whip, out the ferrites and extra screws on the case etc. and they get it to squeak by. The shocking secret is that the unit that passes with all the custom kludges is not the unit that goes into production. The unit sold to the customers radiates as badly as the unit that first found its way into the FCC lab.

So Joe consumer, dosn't really know that his home computer is wiping out 20 meters for the ham two streets away. If his home burgler alarm is causing herringbones on channel two he blames the TV or the Antenna, maybe even the ham two streets away.

We bemoan FCC's lack of vigilence on the ham bands, even commercial freqs are rotten with pirates in some localities, but the current situation with computing equipment is shameful. Each day, more and more of these wideband radiators are entering our neighbourhoods. The impulse crud is bad enough, but then we also have to fight light dimmer buzz and digital dirt.

The fact of the matter is that manufacturers are cheating. They kludge a model together that squeaks through Part 15, Sub J. Then they fob off crap to the public. Most do that. I have seen some production big name stuff on test turntables that failed miserably. I bet the salted version the lab saw passed OK. Some poor soul making peripherals who was foolish enough to buy one off the shelf to use as a test platform got a nasty shock.

All this is bad enough, but then we come to TNCs. I have an old homebuilt TNC-1 in the "Gucci" case. I made a few filtering mods on the in and out lines as I assembled it and it is the quietest TNC I own. I also own a Pac-Comm Tiny-2 TNC, its footprint may be tiny, but its RF output is pretty prodigious. As it came out of the box, it was unusable, there wasn't a signal on the 2 Meter band louder than the crud from the Tiny-2. Now, come on, this damn thing is supposed to work with radios. Did anyone ever test it with a real radio? Well I fixed it myself on the diningroom table. If I could do it that way, couldn't the manufacturer have done a better job with a lab and production facilities?

Then foolishly, I bought a Heath Pocket Packet TNC (HK-21). It seems, the smaller the TNC, the more it radiates. This thing is a pig. Out of the box, it is damn near unusable. I expect better from Heath, what were "The Hams at Heath" doing? I have covered the plastic case with copper foil. With that and getting it far enough away from antennas and radios, it sorta works. One day I will get so mad at it, I will fix it. But here's the best part: It is a certified Part 15 sub J class B device! Says so right there in the first page of the manual. Has the number on the case too, but I had to cover mine with copper tape to try and keep the crud in. How did they test this thing for emissions? The only way I could see them doing it is with the unit switched off. Seeing as this unit is sold especially for portable packet where the rig, antenna and TNC are in close prximity it is pretty negligent. I know, this is a Japanese device purchased by Heath, but they put their name on it and are exclusive importers to the US.

I bitch to manufacurers about this, but they don't seem to care. I know they can make stuff that doesn't wipe out everything from 2 to 300 Megs. It does not cost anymore to make anything RF quiet to meet Class B. It is not difficult to do, it is really easy to do in the design stage. It is not too hard to do at the prototype stage. I am sorry if I have rambled on for too long, but this is a pet peeve. I hope what I have said was relatively coherent.

Yours

>
>The issues in a past posting here, and in a recent (June!) article in 73
>Magazine about the alleged theft of Net/ROM code in TheNet has got me to
>thinking again about these issues.

Good! THe silence has been deafening. When I posted on the subject, I
got almost no response, except for a few pieces of email such as one
from a non-sentient who said "TheNet works for me and that's all I care."

>Reverse engineering is in fact quite commonplace.

Sure. But there's a difference between reverse engineering to figure
out how something works and reverse engineering to be able to mechanically
copy the original author's work. TheNet is the latter. It's called "theft".

>One thing I do wonder about is how good the specs are, and if they are even

The TNC-2 was always sold with complete schematics and technical descriptions.
All the chips are off-the-shelf and their programming info is available from
the chip vendors.

>Would TAPR
>be willing to give them out for copying costs, sell them, or are they just
>wanting to keep them as a trade secret (and a challenge to hackers)?

They came with every kit. I don't know if you can get them
without buying even one kit. I would guess so but I dunno. But
then the kits were pretty cheap and you need one to run your code
on, don't you?

>Also, would the make of Net/ROM be equally as willing to reveal the protocol
>details about how Net/ROM nodes talk to each other (what goes over the air)
>so that a truly legitimate original effect at cloning Net/ROM would be at
>the least, compatible with Net/ROM as a network component?

Yes. The protocol manual was sold to all comers for $5. It specifically
invited others to make compatible products. And Dan Frank has implemented
just that in the Phil Karn (et al) TCP/IP system.

>I'm not sure who to contact about getting the above information, so I have
>not yet actually tried. This information is clearly NOT as readily available
>as DDN/Internet protocols are, nor are they as readily available as mods to
>popular Japanese radios.

Pretty available. If you want specific mailing addresses, rather than just
an answer to the question "is it available", send me email and I'll
dig them up.

>I see no reason that there cannot be hardware sold commercially that can be
>the base for a programming effort, and not be a full blown PC with a ton of
>added cards.

TAPR has done that with the TNC-1 and TNC-2, and the less-successful NNC.
On the other hand, a basic clone PC with a floppy is as cheap as

just about any new radio/HT/mobile rig you can name.

>What I would like to see is for the manufacturer of each kind
>of equipment for amateur radio that uses a processor (TNC's, HT's, base rigs,
>mobile rigs, and even repeater controllers) to supply clear and complete
>programming specs for their hardware so that the software hams among us all
>have a chance to program the hardware to do the things we want (and think of).

This is unfortunately less likely. TAPR is a ham club. The
others you mention are not. NET/ROM is from a small company (two
hams, I think) and they published their protocol but not their
code. The radio makers are publishing their computer-controlled
interface specs. But code for a repeater controller is pretty
unlikely, since that's their bread and butter. If you'll sign a
non-disclosure agreement, I'll show you mine. It's been on the
air on four or five machines here in Boston for over a decade.
Nice easy Z-80 assembler. :-)

>Let's have some innovation on the software side as well. Net/ROM was just
>a start.

You are aware of the KA9Q TCP/IP effort, I assume? Lots of us have
contributed to that.

Buy a (licensed) clone of a TAPR TNC (e.g., the MFJ) and you will find a
complete schematic in the back of the manual. This plus standard data
sheets for each of the main components (CPU, SIO, etc) are really about
all you need for "hardware specs" when it comes to programming. (In the
case of the SIO you'll probably find your biggest handicap to be Zilog's
very poorly written programming manual.)

>Also, would the make of Net/ROM be equally as willing to reveal the protocol

The NET/ROM manual contains an (admittedly sketchy) description of the
internal protocol headers. Even without these, however, one can "reverse
engineer" the protocol without ever removing the EPROM from its socket
and disassembling the code -- you simply watch how it behaves
externally. Ask Dan Frank, W9NK, who wrote the NET/ROM emulation code in
my TCP/IP package -- I'm sure he can tell you in gory detail how he did
it. Software 2000 has repeatedly stated that Dan's work does not in any
way infringe their copyright, and that they in fact welcome his work.

Phil

Could someone please tell me what kind of PSK modulation is used on FO-12
mode JD. What about the "MicroSats"? I understand G3RUH has a PSK modem kit

that works with FO-12 on mode JD, and "RadioKit" sells a PSK modem kit for satellite use.

...But what do these modems consist of?? Are they similar to BELL 212??
Do they run BPSK? QPSK? What baud rates are involved??

HELP! (Please!)

My packet station has a KPC2, a modified motorola HT220 with a power amp (~7W) mounted in a metal box, and a switching power supply. The antenna is about 20 feet away in the attic. I used small coax cable to connect the speaker and mic lines. I got things so that the radio, when unsquelched, would hear more hiss than digital crud. But I found some RFI on TV channel 4 and 5. I tried shielded RS232 cables, no good. I had some small ferrite life-saver shaped beeds with two sets of wire with about 13 turns. The beeds are about 1/4' diameter. I put the beeds in all the lines of the RS232 including the grounds (the RS232 required only 2 signals, pins 2 and 3). This reduced the rfi a lot. The many turns of wire on the beeds was what it took to stop the rfi (I tried a beed over a wire (one turn) but that didn't do it). It looks like that putting a beed in the ground was also needed, to keep the RS232 cable from acting like a long-wire radiating antenna. I didn't use beeds on the mic and speaker and ptt lines, guess that those grounds are better grounds than the RS232 grounds on the TNC. (rfi can drive one nuts! :-))
-> (Just another thing to try when fighting RFI) ^

I think we all have had problems here. I am trying to get my computer
usable while I'm doing mode B satellite operation. Now I am piecing
together a clone dedicated to full time TCP/IP. Maybe you, or someone
can offer some suggestions and tecniques for shielding our own
equipment. I will offer what little I know about this "black" art.

Some things can really only come from the manufacturer and designer.
Short runs on the PCB, proper ground planes and such. Data buses,

clocks and other signals need to be properly terminated.

Shieleding, I belives is very important, as are chassis grounds
connected to the ground planes on the PCB. A line filter should limit
the conducted emissions. Magic juju beads (ferrets (ferrites:->)) on
the cables exiting the machine are a band-aid but can be effectives.
Clamp on ferrites on disk drive cables in the box help also.

These are tips I have pickup up from the EMI guys but I am sure there
are other tecniques and I hope someone with more knowledge will share
it with us. Thanks...

Some notes from Holland, where we seem to manage with only 2MHz on 144..

In article <2631@splut.UUCP> jay@splut.UUCP (Jay "you ignorant splut!" Maynard)

Huh? 145.550 is used in Europe as a simplex channel. I can't imagine
any satelite group using that frequency for satelites. Has the complaint
been checked?
Apart from Shuttle and MIR activities (where people were just requested
to QSY if they interfered), I see no connection between 145.550 and
space operations.

>>Remember that the 2m band in Europe, a very densely
>>populated continent, is only half as large as ours. Yet this hasn't kept

>also run, not by individuals, but by (large) ham clubs.

Not true, at least not in Holland. Yes, government officially gives
the special repeater licenses. However, they do this directly on the
directions given by the amateur radio clubs. Thus, in fact, the clubs
manage the repeater allocations.

What's different is, that we didn't allow any repeaters for special
groups, or more than one repeater for the same working area.
Some years ago, someone got a map of Holland, drew some circles
on that, and every circle just got ONE repeater allocated - per band.
If somebody else wants to set up a repeater, he can't get a license
and cannot run the machine unattended (note that experimental repeaters
can be set up, but if the owner leaves, that repeater must be SHUT OFF.
The same applies for digipeaters, BBS and other stations.)

Also, closed repeaters are out of the question. We can't have the luxury
(hope i spelled that correct - it's late) of reserved frequencies on
tightly used bands. If I read all your messages, I wonder if the USA
still can afford closed repeaters on 2. Why not move those repeaters to
higher bands?

In the past, some repeaters were set up on 145.800 and 145.825.
These frequencies are no longer available for repeaters, and the existing
repeaters have moved. Thus, it can be done!

==========
= Announcing a new release of the KA9Q Internet Package, revision 890421.1 =
==========

This release constitutes an attempt to merge the best efforts of everyone how has been working on the KA9Q package since the last official release which was dated 871225.0. For those who've been tracking the beta releases, this package was built from 871225.33alpha.W9NK.4.1, with many additions. All users are encouraged to upgrade to this release as soon as possible.

Developers should be aware that this package likely represents the last official release of the KA9Q package until Phil finishes his internal rewrite to include a multi-tasking kernel, now known as the "NOS" version of NET. All development effort for new applications should be directed towards NOS.

Revision 890421.0 was distributed in a limited fashion on PC floppies at the Dayton Hamvention. For PC users, there is no appreciable difference between .0 and .1, other than the addition of modem dialing for slip, though the documentation has been somewhat improved.

The things that have changed since the 871225.0 release are too many to remember, much less mention, but here are a few highlights:

- addition of official support for the Atari ST, NEC PC-98XX, HP Portable Plus, and various System V Unix systems in addition to the PC and its clones.

- support for the FTP, Inc., packet driver specification on the PC

- support for IP transport over NET/ROM networks, and some NET/ROM

user level functionality

- prompting for username and password in the FTP client

- a Finger application, similar to Berkeley Finger

- an AX.25 mailbox

- addition of support for the W2XO PBBS when running under System V Unix, using SysV IPC between NET and XOBBS

- A complete rewrite (still rough, unfortunately) of the documentation

- conversion to the Borland Turbo-C 2.0 Professional Package for compiler/assembler/linker on the PC. This was done in response to heavy demand from the user base, and sets the stage for exclusive use of TC 2.0 in NOS. The package "almost compiles" under Aztec C 4.10d, and can probably be made to work... I just don't have time.

- addition of support for the MIT slfp serial line framing protocol

- modem dialing for slip and slfp

Contributions to this release came from *many* folks around the world, again too many for me to remember or mention. Special thanks are in order though for Bob Hoffman N3CVL who made this release possible by sorting through the muck and providing me with sources to the W9NK.4 version with SysV Unix merged in, and to Ron Henderson WA7TAS who made the Turbo-C 2.0 support work, added the HP Portable Plus support, and hopped in to do some dirty piece of work every time I was ready to give up in disgust...

HOW TO GET THE BITS:

Via FTP on the Internet:

The machine col.hp.com contains a copy of the distribution in the directory ~ftp/ka9q. Access is quite reasonable from other sites on the HP Internet, but *very* slow for folks outside HP. This site is recommended *only* for HP employees.

The bits may be found on tomcat.gsfc.nasa.gov in a directory somewhere under anonymous ftp called net-8904. This is a good place to grab the bits from right now.

The bits will make it to wsmr-simtel20.army.mil shortly. This is going to be the most stable Internet access point, I believe.

The latest alpha/beta release bits are frequently available from the machine louie.udel.edu, in the directory ~ftp/pub/ka9q, but users are warned that the code on louie is *guaranteed* to be broken in one way or another, so unless you're working on porting to a new

target system or similar, *stay away* from louie.

Via UUCP or Phone BBS Download:

I no longer operate a telephone BBS system, nor do I support uucp from 'winfree' for grabbing the bits... my apologies for the confusion this has no doubt created.

Howard Leadmon, WB3FFV, has the bits available on his BBS, which also supports UUCP.

System Name: WB3FFV
Login: bbs
Number: (301)-335-0858 -- 1200 & 2400 (Non-MNP)
Number: (301)-335-1955 -- 2400 (MNP), 9600 & 19200 (PEP)
Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)

Other folks also have BBS systems, if there's some other machine that you frequent for packet radio related software, check there first, and look for some indication of the version number.

Via Mail:

The Tucson Amateur Packet Radio association (TAPR), is distributing copies of this release on IBM-compatible 360k 5.25" floppies. They also can provide KISS firmware for the TNC-1 and TNC-2, and clones.

TAPR can be reached at:

TAPR
PO Box 12925
Tucson, AZ 85732
USA
+1 602 323 1710

TAPR continues to be a leader in packet radio research and development, working with AMSAT on the microsat packet satellite project and a joint DSP project. The 'Packet Status Register' newsletter is well worth the membership fee. TAPR supports us, please support TAPR!

HOW TO REACH ME:

In the past, I included my mailing address and telephone number in these release notes. While the list of return addresses and folks who have contacted me is fantastic and astounding, I find that the amount of time required to deal with phone calls and paper mail has gotten a little out of hand. Therefore, I must request that questions about this release be sent by electronic mail, which is easier to cope with on a time-available basis. I *do* answer my mail when a working return address is provided!

Hello All,

As of this message I have just placed the NEW release of the KA9Q TCP/IP software (the new POST Dayton release) on my BBS. This is release 890421.1, and it replaces the 890421.0 release that was made avalible at Dayton. From what I hear from Bdale, this release contains some enhanced features, and improved documentation. Anyone that is interested in the software is welcome to download it from my BBS, or use anonymous UUCP...

> TAPR has done that with the TNC-1 and TNC-2, and the less-successful NNC.
> On the other hand, a basic clone PC with a floppy is as cheap as
> just about any new radio/HT/mobile rig you can name.

Not as small as a Kantronics TNC is. Also, consider the power drain of a clone PC. Typical TNC boxes are cheaper than clone PC's but that alone is not enough. Their small size and low power make them rather nice. Now what I want to be able to do is leave my PC at home and develop software of my own design to run on the TNC, burn PROMS, and run them.

> But code for a repeater controller is pretty

> non-disclosure agreement, I'll show you mine. It's been on the
> air on four or five machines here in Boston for over a decade.
> Nice easy Z-80 assembler. :-)

Obviously you must be selling it or anticipate the possibility of selling it. I have ideas I'd like to see in repeater control logic. Buying and running a repeater would be a major investment for me, and I would not do so unless I knew that I would have lots of control over how it worked.

Is your code running on commercially made repeater controllers? It was very frustrating talking to the sales people for some of the repeater makers at Dayton because they just didn't understand the things I was talking about. When I said "program the repeater", they kept saying things like "sure, you can program it, you can turn any feature on or off that you want". ARRRGH!!! Their features were mostly uninteresting.

Perhaps if you are interested, we could talk by Email about what features and ideas for repeater controllers.

> You are aware of the KA9Q TCP/IP effort, I assume? Lots of us have
> contributed to that.

Yes, and I think it is great. I would like to see innovations in other areas as well. Everything with a CPU in it should be programmable by anyone interested and willing to do it. The quality of so much market driven program design these days is rather pathetic. That's why I cannot work in industry as a programmer; it would be too limiting for me.

The easiest way to put a Sun workstation (like the 3/75 I'm typing on at the moment) up on packet radio is NOT to modify anything on the Sun. Just get a cheap, stripped PC/XT clone and use it as a dedicated IP gateway between a local Ethernet and the packet radio channel. Then plug your Sun into the Ethernet and let it talk to the world.

That's what I do here, and it works quite well. The only modifications to the software on the Sun involved making sure I was running the latest Van Jacobsen/Mike Karels version of TCP, so that it would behave reasonably when operating over slow and unreliable packet radio paths. The Sun knows nothing whatsoever about AX.25, but that doesn't keep it from communicating with sites that do speak AX.25 (as long as they speak TCP/IP on top of it, that is). This is what "internetworking" is all about.

Phil

>
The FO-12 downlink is 1200 bps BPSK. The same format will be used for the Microsats. The RadioKit modem is in fact the G3RUH kit. However, there is another kit available from AMSAT and TAPR which is demonstrably superior to the G3RUH design. It is based on a Japanese design, with some tweaking by some of the TAPR folks. It also includes the Manchester encoder needed for the 1200 bps FO-12 & Microsat uplinks. I homebrewed a modem from the original JA design, and was very impressed with it. In the early days of mode JD, before they started up the mailbox software, I worked 9 different countries using the satellite as a digipeater (which probably makes me the "packet satellite DX King" - any challengers?). :-)

The PSK modem bears some resemblance to a Bell 212, but the latter is a 600 Baud QPSK modem, so they certainly aren't compatible.

I've tried to get Phil's code via the nearest BITNET-server
(TRICKLE AT DKTC11). It is said that these servers contain
directory-listing from SIMTEL20 and request files there.
However, I found that TRICKLE had only a few files in the
<MSDOS.KA9Q-TCPIP> -directory, and none of them were of interest.

Have any BITNET-users any knowledge of other servers that contain
the files/dir.listing I would be glad to know.

Please mail me direct as I sometimes don't get the bulletin.

>trying to move an established repeater, then you are in for a battle. Not
>necessarily impossible mind you (I don't agree with Jay Maynard :-) but
>a battle none the less. If you cause a problem to simplex users they only
>need to change to another simplex freq., (a flip of the dial) not redo a
>whole repeater.

The problem isn't more Simplex frequencies for packet, it's having ANY
REPEATER frequencies for packet. The only thing odd-ball splits will
buy you is to let you squeeze into the usually-simplex areas (200 kHz)
in the middle of each repeater MHz. The FCC won't let you put a
repeater on 145.71 or 144.49.

You need real repeaters in order to get CSMA or CSMA/CD operation.
CSMA requires that you abolish "hidden transmitters" so you can hear
everyone else when you're listening. CSMA/CD requires that PLUS
hearing everyone else when you're transmitting. The latter means you
need either duplexers or crossband operation. Sure, you can squeeze
a crossband operation into the area around 147.5 and again on 450
someplace. But it's not a generalized answer.

>2. Most radios today DO support non standard splits. The ones that don't are
>the exception to the rule. You name me one that doesn't (and I know there are
>a few) and I'll name you 10 that do. :-)   And if you really just HAVE to
>use one that doesn't support it (such as an ICOM IC-2AT) then you can easily
>modify it to where it does. Am I out to lunch here?

Well, neither my FT221 nor TH21AT support odd-ball splits; both use
discrete crystals for offsets. They'r both old, of course; brandy-new
radios can do oddball splits, but they've gotten costly. All the
non-HT radios now have silly voice-oriented bells and whilstles.

>Lastly and as an adjunct, have you read about the proposed idea of using
>DAMA (Demand Assigned Multiple Access) instead of CSMA on packet radio?
>The idea seems to have merit and solves the problems of hidden transmitters
>in a much more elegant fashion than a duplex digi... although I agree that
>duplex systems are pretty slick.

Lots of problems there. Polling time is too long with T/R switching
delays; else it's too inelastic of varied demand, it's messy to get
a node attached, etc. Nice hack concept but I don't think it'll ever
work for ham radio. Just an opinion of course. CSMA is easier to make
work. Cheap, too, except of course that the FM boys have a stranglehold
on the bands in many areas.

Well, I got back a few hours ago from the above. From what I saw (from the back row), the comission that was conducting the hearing was for the most part much in favor of hams. There were 4 'witnesses': The ARRL, the FCC, UPS, and DOD. Each was allowed time for testimony, and then each member of the comission was givin time to ask questions at the end of each witnesses testimony.

I didn't take notes, but here are some of the high points:

The ARRL described activity on 220, and brought along a packet station. One of their main points was that only on 220 is the channels for wide-band packet, and this is now done in the portion that the FCC took. Also they talked about expense and trouble of re-allocating present stations (FM, packet, EME, etc....), and related this to a game of musical chairs, with the FCC yanking the chairs away.. There was a lot more, and I expect to hear from Chris Imlay later this week with more info...

The FCC was up next, and was quite comical. One of the best laughs was when they were asked if they had tried to find other alternatives to taking away part of 220 -- "Well.....". Also they were forces to admit that they based their idea of the usage of the 220 band on an old copy of the repeater handbook -- stress old. (The ARRL explained eariler that the direcory does not list everything, and lists NOTHING about what's below the repeater allocations).

UPS was very frank -- they didn't care what frequencys they got, as long as they got them, and if the FCC assinged something else, it wouldn't cost them much to change their plans.

DOD came out in support of the amateurs -- they said the FCC had been given comments, but had choosen to ignore them...

Those were my impressions. I think the comission is going to ask the FCC to reconsider, but no decisions were officially given today..

Keep your fingers crossed.....

Red Ryder 10.3 comes with the Font TTY-VT52-VT100 in 9, 12 & 20 points.

If someone has a 10 point version of this font, I sure would apprecate
a copy. Just put in in a seperate suitcase and E-mail in BinHex format.

The 9 is too small and the 12 is too big. Sure would like to have the
10 point version.

I've been told of a number of programs for the Commodore 64 (and/~ror 128) that offer a packet terminal or act as a packet BBS..if any of you have or know of such a thing, I would appreciate any information that's available.

have you had a look to the DIGICOM package ? All you need for it is a separate modem. It will give you the features of a private BBS, through connects with hop-to-hop-ACK for other stations, sophisticated remote controll, comfortable file transfers etc etc.

After all it's available without charge.

 Msg# TSP Size Read To   @ BBS From   Date/Time
 25987 BN   1338   2 ALL   VE3IWJ 8903/0218
 Subject: KAM mod (easy)
 Some of you might have read the bulletin I wrote about improving
 the carrier detect on the KAM. This mod greatly improves the
 reception of packet as well as prevent you from transmitting on
 top of an other signal.
 The best way to do this mod is by just soldering a 22k or 27k
 resistor across R47. R47 is a 220k resistor. It might be a bit
 difficult with out the right tools to remove the old R47. So
 leave it in and just solder the new one across it on the other
 side of the board.
 The mod changes the time constant of the rc network formed by
 C29 and R47. Which is part of the carrier detect function on hf.
 Now that it operates faster, it will do a better job. You should
 see a lot more stations while monitoring and have less retries
 while connected or trying to connect.
 I would like some feedback from people who tried this.
 73 de Nand ve3iwj @ ve3iwj.
 note: I have not tried or verified this mod, proceed at your own risk.

In article a recent article by IBTUSM02@CZHETH1I.BITNET (Tom Anna):
>
>
>Why not do it ALL in software ? Hardware requirements: 1 A/D converter
>8 bit / 8kHz, a little buffer RAM, and some TTL stuff, all together on
>a small PC plug in card. This card digitizes the audio signal from the
>receiver in a CD player style, and makes it accessible to the computer.

This can be done, but you can probably get an 8530 (or other SCC) and a
modem (e.g., 7910) for less than the price of the above hardware. In short,
yes you can do it, but why?

>Software: Some digital filtering, a demodulator and a packet disassembler.
>If you sample the audio signal with 8K samples/sec, there is 125 mikro-
>seconds CPU time per sample: This should be enough for these tasks.

In my not-too-long-ago days, I'd say "gofer it!", but today I'd say "you're
reinventing the wheel." If you want to do it for a learning experience, then
by all means, have at it! If you are looking for an inexpensive (and quick)
way to get on packet, this probably isn't the way to go about it.

>Only by software changes you could also receive RTTY/AMTOR/SSTV/weather ...
>With little extra hardware you might also transmit all these modes.

Now there you go! If you really want to support a multitude of protocols/
standards, design a board using a DSP chip (TI 32010, Motorola 56K, etc.),
an ADC/DAC, and the required glue and you're REALLY cooking! :) Let the
host processor format the data and let the DSP chip do all the filtering and
signal generation/detection/decoding. The AMSAT/TAPR folks are working on
a project similar to this, and I believe it really holds a lot of promise.

I think this is a holdover from when we hoped that .ampr would become a top
level domain... now that it's officially .ampr.org, I've been pushing people
to put either simple hostnames without the .ampr.org, or fully qualified
domain names only, and not anything in between... you suggestion of punting
the .ampr.org on traffic over the air for the moment seems like a good one.

I've been reading about alternatives, etc to tnc's and ax.25 packet.
This is most provocative. I am not familiar with the radio part
of communications other than a frustrated usr of packet radio via
a hd4040 tnc @1200baud. I KNOW that there is a better way...

It seems to me that if a telebit modem can fly at some higher speeds,
and that the telephone industries can do ISDN (they too need a better
spec) than where can we go. Can't we do multidrop 9600+ communications

like the telephony industry. Why can't a bbs feed be multidrop, then
I won't have to "dial" ops "connect" to one, I'd have my mail on my
BOX where it belongs. With the compression techniques like PKZIP's
archiving program, why can't we incorporate it the scehme of things?
I just heard of a program called flashlink which provides mnp 4 and
mnp 5 additions to the standard modem interface (via software) to
speed up the through put? Why can't the actual packet size be variable
for higher through put? Why can't we do full duplex communications
on the radio, repeaters do it?

As you can see I have a lot of questions, it seems that some of the
local people that I have spoken to have no interest in advancing
the sport. I have found a few that are willing to do Usenet mail
via radio (probably using tcp/ip), but I have a lot ot learn.

Thanks,

     Curtis (!rochester!kodak!n2hkd!curtis or cb@cci632.uucp) N2HKD

RTTY DX NOTES FOR WEEK ENDING 17TH MARCH 1989.

THIS WOULD HAVE TO BE ONE OF THOSE WEEKS THAT WILL BE REMEMBERED FOR YEARS BECAUSE OF THE SUN SPOTS, AND THE DEATH OF THE BANDS. LAST WEEKEND WOULD HAVE BEEN THE ONLY DAYS WHERE DX WAS AROUND IN THE NORMAL STRENGTH. BUT WE HOPE FOR BETTER CONDITIONS FOR THE B.A.R.T.G. CONTEST THIS WEEKEND. SEE YOU IN THE DOG PILES.

OUR THANKS THIS WEEK GO TO TG9VT, W9CD, W1DA, OD5NG, I5FLN, LA9CE, HB9CJC, VK2EG AND OTHERS. THE INFORMATION IS APPRECIATED.

DL1OAX/UG6 SAYS CARDS TO HIS HOME CALL, INER MUNDT, BAECKERSKAEMPEN 17, 3070 NIENBURG, FED GERMANY.

HH2PJ CARDS GO VIA BOX 13146, DELMAS, PORT AU PRINCE, HAITI.
YJ8JS SAYS TO QSL TO G0CGL.
A CORRECTION TO LAST WEEK. THE QSLS FOR THE U.S. STATIONS WHO WORKED THE 3W1 OPERATION GO TO W4FRU NOT WA4FRU. REPEAT, THEY GO TO W4FRU.
ALSO THE CARDS AND CONTRIBUTIONS FOR THE VU7JX OPERATION THIS WEEKEND GO TO W2XP.

NOTES OF INTEREST.

THIS WEEKEND VU7JX WILL OPERATE DURING THE BARTG CONTEST FROM THE LACCADIVE ISLANDS. QSL VIA W2XP.

THERE IS A REPORT THAT OCEAN ISLAND WILL BE SEPERATED FROM KIRIBATI, AND COUNTED AS A NEW COUNTRY.

DJ6JC WILL OPERATE FROM TY6JC, BENIN, STARTING MARCH 25TH FOR ABOUT 7 DAYS.

APRIL.

5W1GP WILL BE QRV FROM ROTUMA FROM 6TH APRIL. HIS LENGTH OF STAY IS NOT KNOWN, BUT HE WILL BE OPERATING BATTERY EQUIPMENT.

XF4L REVILLA GIGEDO WILL OPERATE FROM 11 TH TO 19TH. THEY HOPE FOR RTTY OPERATION AS WELL AS OTHER MODES. QSL TO OH2BN.

MARION ISLAND, ZS8 WILL BE ACTIVATED DURING APRIL. EQUIPMENT HAS BEEN DONATED BY W6PQS AND THE SOUTHERN CALIFORNIA RTTY GROUP.

MAY.

ST PETER AND ST PAULS ROCKS WILL BE ACTIVATED 3RD TO 10TH JUNE. THE RTTY CALL WILL BE ZY0SY. OPERATION BY THE NATAL DX GROUP, BRAZIL.

JUNE.

TK/HB9CJC WILL OPERATE FROM CORSICA FROM JUNE 4TH TO JULY 2ND. QSL TO HIS HOME CALL.

JG1RVN WILL OPERATE FROM KC6, BELAU, DURING JUNE. QSL TO HIS HOME CALL.

AUGUST.

ANGOLA HAS BEEN DELAYED UNTIL AUGUST DUE TO CHANGE OF MILITARY PERSONNEL. QSL VIA I5ICY.

NOW FOR THE RUMOURS. IT HAS BEEN UNOFFICIALLY REPORTED THAT TUBUAI ISLAND, CHESTERFIELD ISLAND AND FREDERICK REEF WILL SHORTLY BE LISTED AS NEW COUNTRIES. (??)

GL DE DX1.

Subject: Directory Service Description Draft 1

I have enclosed Draft 1 of a Directory Service Outline for
your comments. for now I am sending this to the following
individuals: ka2bqe kd6th w0rli wa7mbl k3rli wd6cmu n6vv kb7uv
wa1lou wb2mnf w2vy ve3gyq w4ri, w2jup, kb1bd ka2usu and n2ids.
Feel free to circulate this as you see fit. If you would like
others added to the list please let me know. I will be posting
this to the packet BBSs, netnews rec.ham-radio.packet and CI$.
After getting comments I will be adding fields, formats and
validation criteria to the fields. Thanks for your interest.

               Directory Service Outline - DRAFT 1

J. Gordon Beattie, Jr., N2DSY

The Radio Amateur Telecommunications Society

For the last several years packet system software developers and users in the Amateur Radio Service have been experimenting with simple directory servers. These usually provide callbook and/or "home BBS" data through local transactions or a remote mail interface. These systems include WD6CMU's WP, the W0RLI server and the WA4ONG Callbook servers.

The user base has expanded and with it the interests and associated information needs. many activities would be supported if a directory server contained information on network addresses, frequencies, e-mail addresses in forms other than what is currently used by packet BBSs and possibly even organizational data. Organizational data might allow mail to be directed to "ARRL Hudson Division Director" or "ARRL Northern New Jersey Section Manager".

The objective of this discussion is to facilitate interoperation between directory systems which support the advanced capabilities required by this evolving environment.

In order to determine what specific steps need to be taken to produce these systems, some basic questions need to be addressed. The first deals with directory data elements. The directory data elements may vary from system to system, but some common specification is required including:

1. The format of individual data elements;

2. A minimal subset of data elements that must be selected and supported on all systems;

3. The use of aliases for some data elements must be permitted and defined;

4. Relationship(s) of the data elements must be defined;

5. A mechanism to control access to a data element and its value is needed.

The second question deals with functional requirements of the systems. Each item may be broken up into several items, and then either fully or partially supported.

1. There are operations which may be used by users and/or systems. These operations may be invoked with parameters

arranged as a filter. Filter constructs such as "equal to xxx" or "greater/less than xxx" are provided. Several of these constructs can be used to qualify an operation.

* Basic operations should include:

  Read - one or more attributes of a particular entry

  Compare - one or more attributes of a particular entry

  List - of entries subordinate to the entry selected

  Search - of the directory based on selected filter attributes

  Abandon - a previously invoked request of the directory

* Advanced operations should include:

  Add - an entry to the directory

  Remove - an entry from the directory

  Modify Entry - attributes and/or attribute values

  Modify Name - of an entry in the directory

* Results of these operations can come in one of four ways:

  Complete Results - in which case the request is fully satisfied

  Partial Results - in which case the request is satisfied without an indication of possible further action

  Referred Results - in which case the request is satisfied with an indication of possible further action

  Errors - in which case something was wrong with the semantics of the request.

  The operations may be concatenated together to produce a specific request. An example would be a wildcard search of all BBSs in New Jersey with an indication that the resultant response include callsigns, network addresses and a list of supported distribution lists. This would use the "Search" and "Read" operations.

2. Proposed user sematics should be defined solely for the purposes of understanding specific requests of the directory. We should not try to impose a set of sematics on a particular developer or user community.

3. Remote or local use for each of the functions should be defined.

4. Automatic referral of requests to another system(s) supporting data elements requested but not available on the receiving system.

5. Some mechanism is needed for transport of remote requests - any of the standard mail formats perhaps?

6. For remote use of advanced operations (at least) we will need a method for authenticating the user and/or message.

Summary

Now let us get practical for a moment. First, the systems you have may already do some of these functions. Second, the system outlined above is complex to implement, and probably unrealistic to expect in the short-term. I am asking that we work toward building interoperable systems by doing a bit of up-front, collective high-level design. This will provide developers with a common "blueprint" for directory system implementation. From this "blueprint" will be able to identify additional functions and data elements.

Appendix A

These section outlines a proposed set of directory elements which might be supported by a directory system. This directory system would provide support for the following services:

1. Standard packet BBS mail routing (WP-type)

2. Domain-based mail routing for X.400 and Internet systems

3. Network routing for OSI systems based on the Network Service Access Point Identifier (NSAP-ID).

4. Network routing for DoD Internet systems.

5. Net/Rom or other network node

6. Organizational Role Alias for ARRL Officials so that mail can be directed to a Director, Section Manager, etc.

7. Organizational Role Alias for officials of other organizations

8. Organizational entries to support referral of inquiries to organizational directory databases

8. Postal Address lookup

There will be directory entries for people, organizations, devices and applications. In order to get the crew thinking about possible elements I have created a sample set of data elements for a directory entry of a "Person" are outlined below:

```
ENTRY ::= Person

POSSIBLE SUPERIORS{
    Top
    Country
    Organization
    }

MUST CONTAIN{
    Common Name (Amateur Callsign)
    Begin Time DEFAULT (Time of Entry)
    End Time DEFAULT NULL
    }

MAY CONTAIN{
    Amateur Radio Specific Attributes
      CONTAINS{
        Surname
        Given Name
        Nickname
        Message Handling Attribute Set
           CONTAINS{
             Home PBBS
             X.400 Address
             Internet Address (SMTP)
             }
        OSI Domain
        NSAP-ID
        Internet Domain
        Internet Address
        Node Name
        Organizational Role
          CONTAINS{
            Organization Name
            Organizational Unit
            Title
            }
        }

    Locale Attribute Set
      CONTAINS{
        Street Address
        Locality Name
```

```
        State/Province Name
        }

    Postal Address Set
      CONTAINS{
        Physical Delivery Office Name
        Postal Address
        Post Office Box
        Street Address
        Postal Code
        }

    Telecommunications Address Set
      CONTAINS{
        Telephone Number
        Facsimile Telephone Number
        X.121 Address
        }
```

Does anybody know of a packet bulletin board system for
Unix SysV (CTIX) -based computers? The system would preferably
follow the standard RLI/MBL -procedure for forwarding
messages.

We would like to get the source code for such a beast,
and port the system on our Convergent Miniframe computer.
A complete, ready-to-run system would also be acceptable,
if there is such thing around...

Also, please, can somebody tell me the e-mail-address for
Hank, W0RLI? We would love to discuss the possibility to
get the latest source code of his bbs software. We are currently
running a WA7MBL 5.12 bbs on a pc/xt, and we are QUITE satisfied.
Anyway, a true multi connect, multi process system would be
of GREAT interest...

Thank You in advance and vy 73,

-- Luru --

In article <525@cvman.UUCP>, gdelong@cvman.UUCP (Gary Delong) writes:
> THIS IS A CALL FOR VOTES on the creation of rec.ham-radio.rules
>
> The guidelines require that to create the new group 100 more yes votes
> than no votes are received by e-mail within the 30 day voting period.
>
> Voting starts at 2400 EST February 21, 1989 and will end at 2359 EST
> March 23, 1989.

The stated period for voting having expired, the impartal panel of learned judges comprising the balloting committee gather to count the votes.

Finally, after what seems like hours, a hush fills the room as the chairman of the balloting committee clears his throat into the mike.

"On the question of creation of the Newsgroup rec.ham-radio.rules, An un-moderated discussion of current and proposed rules relating to the operation and licensing of Amateur Radio," he solemnly announces, "We have examined the ballots (said ballots having been secured under the watchful eyes of a pit Icom IC-32AT behind the dumpster next to the loading dock) and we find the final vote total to be ....."

A previously unnoticed display above the podium blazes to life displaying the final tally.

```
* * * * * * * * * * * * *
*                       *
*   voting YES =  119   *
*                       *
*   voting  NO =  24    *
*                       *
* * * * * * * * * * * * *
```

Well, although support has been shown for creation of the new group, the basic requirement for 100 more yes votes than no votes has not been met, (by 5 votes) therefore the new group WILL NOT BE CREATED at this time.

Since the vote did not pass, I don't think I need to waste bandwidth posting list of voters.

It was tempting to slip in a few of the 7000+ local user ids in as
yes votes for the few additional votes needed to slip this one by,
but.... oh well. 8-)

I like to thank all of you for your participation, both your no votes
as well as your yes votes. I attempted to acknowledge all votes received,
but got a small percentage back as undeliverable.

73 all

>a problem. Apparently much of the delay is in starting the various crystal
>oscillators in the transmitter, and these could be run continuously.

I think I may have mislead some people with the term "half duplex". What
I *meant* to say was that the WA4DSY modem transmitter stops the crystal
oscillators (clock and RF carrier) when the RTS (Request to Send) input
line is brought inactive. Dale's intent here was to prevent possible QRM
to the receiver (which is a completely separate part of the modem) when
the two are configured to operate in a half-duplex mode on the same
frequency. Fortunately, the physical layout was done so well that it
seems this concern was largely unwarranted. You can even saw the RF
board into two halves (one TX, one RX) and put the modulator and

demodulator into separate shielded boxes if you want, but I haven't found this to be necessary.

The problem I was alluding to was that the keyed transmit oscillators are apparently the major components of the 15-20 ms keyup delay; crystals are very high-Q devices. Some trivial modifications to the modem would allow these oscillators to run continuously, with only the transverter actually being keyed. I will be experimenting with these approaches in the hope of getting the keyup delay down to the 5-10 ms range, which I understand is the acquisition time of the clock recovery loop in the receiver. (Here there are some fundamental tradeoffs between acquisition time and weak-signal performance, so there's a limit to the turnaround speed of *any* modem.)

There is nothing inherently half-duplex about the WA4DSY modem design when configured to run on different transmit and receive frequencies. You can easily leave the RTS line to the transmitter up all the time and receive data at the same time. There are NO components that have to be switched between transmit and receive, so in this sense the modem is completely full-duplex.

Sorry for any confusion.

Phil

>a hd4040 tnc @1200baud. I KNOW that there is a better way...
Yes, there is. It's hard to think of a worse way, actually, than what's been done already! But let's break it down into the constituent problems.

>It seems to me that if a telebit modem can fly at some higher speeds,
>and that the telephone industries can do ISDN (they too need a better
>spec) than where can we go. Can't we do multidrop 9600+ communications
>like the telephony industry.

A valid question. The current use of 212 modem technology is totally
absurd, but it stems from the "appliance operator" mentality. Ten
years ago some VADGC pioneers had some surplus (already obsolete)
telco 212s to play with; it's also dirt cheap to implement, and fits
into the AF passband (mic filters and all) of commodity FM rigs.
Direct FM would fit 9600 into the same 20 kHz channelization, but
would need better modulators and receivers, and would need to bypass
the audio stages. The Japanese rig builders don't do this, since
their big market is still voice (and not the US, either). Hamtronics
does, but their stuff is otherwise primitive (no synthesizer).

You can do 2400 or even 4800 thru an audio system into an FM rig,
but it's not quite so tolerant of mistuning, wrong levels, etc.
And the turn-around time becomes more significant -- with allthose
relays chattering, shorter packet times get overtaken by T/R
switching time. Again a packet-oriented rig (not a voice one) could
fix that in a jif. Taz Inoue, where are you?

>Why can't a bbs feed be multidrop, then
>I won't have to "dial" ops "connect" to one, I'd have my mail on my
>BOX where it belongs.

That's an application problem; the TCP-IP world does it better,
and some BBSs are smarter than others. Again it's the appliance
attitude "gotta be MBL/RLI compatible" that holds people back.
There was a lot of flaming recently at the autthor of the TCP/IP
package's AX.25 mailbox subroutine, since it needed the user to hit
CR after connect. Too tough for the AX.25 users! (Gimme a break.)

>With the compression techniques like PKZIP's
>archiving program, why can't we incorporate it the scehme of things?
>I just heard of a program called flashlink which provides mnp 4 and
>mnp 5 additions to the standard modem interface (via software) to
>speed up the through put?

Most ham file transfers (on TCP/IP) use ARC or other compression
already. You only need to compress once; compression does however
make data integrity more important. TCP/IP can handle it.

>Why can't the actual packet size be variable
>for higher through put? Why can't we do full duplex communications
>on the radio, repeaters do it?

Packets are variable-size already, both AX.25 and TCP/IP.
Full duplex is very beneficial; a few packeteers do use it, but
it takes a repeater-pair and repeater to do it (duplexer needed),
and the FM voice boys have pretty much claimed the 2m and many

other repeater channels to themselves already. This is a big problem; we do need to shake loose some repeaters! You then get about 4 times the throughtput that you do from hdx digipeaters.
>As you can see I have a lot of questions,

Yes, and they're good ones! Ham packet radio is largely in a rut. We need people to move on from the TNC/AX.25/BBS model into some better things (not NETROM appliances). There is a lot of progress already, though. Stay tuned and plugged in.

Announcement

   On April 16th at 7:30 pm till 11 pm Eastern time, at Avery Fisher Hall in Lincoln Center in New York, a workshop "One Million Points of Light" will take place.   The theme of this event is obviously both toung-in-cheek extrapolation upon US President George Bush's famous phase, "A Thousand points of Light", and earnest metaphor for an attempt to create "Humanity" as a real community. Megavision, a non-profit International project for global humanitarian initiatives, will present and coordinate this international cultural event.

   Telecommunication networking people are invited to attend and have a special role. Especially those who correspond through Email and computer conferencing.   The event will feature computer networkers in their normal activities of communication all around the world as if the earth is a global village. We are looking for people to pass information to commercial networks like Genie, Compuserve, BIX, WELL and all the other commercial and non-commercial networks like Usenet, Arpa net, and the other large area networks.

We invite any suggestions and comments on how we as networkers can contribute to the script of the workshop now in progress.

How do the Networkers fit in?

On the stage will be a command post coordinating all channels of communication through a TeleSet*, while portable workstations will be placed throughout the auditorium for inter-audience communications.

At the event workshop participants will be communicating through a new class of Communication equipment called a TeleSet* Environment. A TeleSet* itself is a machine that integrates the signals from the Audio, Video, Computer, Television and Telephone worlds into a single experience for the users.

Utilizing satellite technology we will have an interactive videophone amongst the participating sites, through TV technologies we will reach the public over cable, through the radio world we will be "on the air", through the computer modem we will be in "Network" mode, and through the telephone there will be people calling in who are watching on TV or listening via one of the radio signals.

Interactive link-ups are expected from San Francisco State University, Moscow State University, Yale University, George Washington University, MIT and the Media Lab (MIT). Additionally, there are proposals for an uplinks and downlinks from Japan, West Germany, Holland, Hong Kong and a rapidly rising number of new locations globally.

This workshop will be preparing the way for a "Global Town Meeting" on June 21, 1989 (Summer Solstice). All previous "Space Bridges", from the early 80"s through now, have been planned and implemented by a few Activists or Media Professionals in a music concert type format or a "Talking Heads" type exchange. The audience has not been given a choice as people have when choosing cultural products like books, films, concerts or theater performances.

The June 21st event will, for the first time, be planned by the workshop participants, which includes approximately 3000 people in Avery Fisher Hall (Lincoln Center) as well as electronic correspondents from around the U.S and abroad.

If we are fortunate we will experience something like our ancestors did in public squares in the Greek city-states or the crowds did in the Forums of the Roman Empire. Quite a challenge...

If anyone out there is interested, please let us know, just Email to me, and indicate which networks you use, such as UseNet, Arpanet BIX, WELL, Compuserve, etc.

It was suggested that I post this bulletin to rec.ham-radio instead of rec.ham-radio.packet. I basicly decided on .packet because both packet and rtty are "digital" modes. It dosent really matter where I post the articles. So its up to you Do you want it posted in rec.ham-radio or rec.ham-radio.packet?

Thanks in advance for your comments.

RTTY DX NOTES FOR WEEK ENDING 24TH MARCH 1989
(BID RTDX2403)

FIRST, WE HOPE THAT EVERYONE HAS A VERY HAPPY AND HOLY EASTER. WE HOPE THE DX COMES TO YOUR SHACK IN GREAT ABUNDANCE. IN THE NOTES YOU WILL SEE SOME STATIONS LISTED AS 28 MHZ, ETC. THESE WERE SOME OF THE STATIONS WHO WERE WORKED/SEEN DURING THE CONTEST. UNFORTUNATELY WE COULD NOT LIST ALL THE STATIONS THAT WERE IN THE CONTEST, AS SOME OF THE STATIONS WORKED OVER 700 CONTACTS. SO ONE MIGHT SAY THAT ALL BANDS WERE OPEN AT SOME TIME DURING THE CONTEST PERIOD.

OUR THANKS THIS WEEK GO TO TG9VT, W1DA, KT7H, LA5WBA, OD5NG AND VK2EG.

BANDPASS:

VU7XP WILL QSL VIA W2XP.
3B8FP WILL RECEIVE HIS CARDS VIA KN2N.
DL1OAX/UG6 WILL QSL VIA HIS HOME ADDRESS. HE WILL BE THE OPERATOR IN ARMENIA FOR A FEW MORE WEEKS.
J73EH QSLS VIA WA4WIP.
TY9JC WILL QSL FROM HIS HOME ADDRESS OF DJ9JC.

NOTES OF INTEREST:

LA2FFA WILL BE ACTIVE FROM ABOUT 84 DEGREES NORTH FOR ABOUT SIX WEEKS USING THE CALLSIGN OF JX0A, FROM 22ND MARCH USING PACKET AND OTHER MODES. NO MENTION OF RTTY.

APRIL.

IT IS REPORTED THAT JIM SMITH WILL BE ACTIVE FROM OCEAN ISLAND, EITHER THE END OF APRIL OR EARLY MAY. IT IS HOPED THAT HE WILL THEN TRAVEL TO TUVALU (T2) IF REQUESTED.

5W1GP WILL BE QRV FROM ROTUMA FROM 6TH APRIL. HIS LENGTH OF STAY IS NOT KNOWN, BUT HE WILL BE OPERATING BATTERY EQUIPMENT.

XF4L REVILLA GIGEDO WILL OPERATE FROM 11TH TO 19TH. THEY HOPE FOR RTTY OPERATION AS WELL AS OTHER MODES. QSL TO OH2BN.

MARION ISLAND, ZS8 WILL BE ACTIVATED DURING APRIL. EQUIPMENT HAS BEEN DONATED BY W6PQS AND THE SOUTHERN CALIFORNIA RTTY GROUP.

MAY.

ST PETER AND ST PAULS ROCKS WILL BE ACTIVATED 3RD TO 10TH MAY . THE RTTY CALL WILL BE ZY0SY. OPERATION BY THE NATAL DX GROUP BRAZIL.

JUNE.

TK/HB9CJC WILL OPERATE FROM CORSICA FROM JUNE 4TH TO JULY 2ND. QSL TO HIS HOME CALL.

JG1RVN WILL OPERATE FROM KC6, BELAU, DURING JUNE. QSL TO HIS HOME CALL.

AUGUST.

ANGOLA HAS BEEN DELAYED UNTIL AUGUST DUE TO CHANGE OF MILITARY PERSONEL. QSL VIA I5ICY.

GL DE DX1.

WARNING ! WARNING ! WARNING !

From: WA2SQQ Bob Kozlarek
Subject: Software Virus
PKZIP/PKUNZIP .92
AM40/AM41

Recent developments in the software world have required the famous PKARC software to be replaced by a new version called PKZIP/PKUNZIP.

While several versions have been seen, the latest appears to be version .92 . Usually listed on landline BBS's is a program which will provide a menu driven screen for PKZIP, usually listed as AM-40 or AM-41.

After running these one time, the embedded virus allocated 13 meg of memory to "never never land". It appears that this "strain" looks to see how much memory is occupied on the HD and then proceeds to gobble up an equal amount of unused memory. The results are devastating if you have more than 50% of the drives capacity in use. With the assistance of Gary WA2BAU I was able to retrieve the lost memory by using CHKDSK /f. For those of you who are not familiar with this DOS command, drop me a line @KD6TH and I'll elaborate. My sincere thanks goes out to Gary WA2BAU for saving me lots of disk handling ! Please pass this on to your local BBS and be sure to include the remedy.

Further to N2EZG's bulletin on constructing an adapter for
the modem socket to improve the performance of Tiny-2 (and
Micropower-2) TNCs that have become "hard of hearing": Gwyn,
W1BEL, of PacComm advises that those not wanting to roll
their own can call and they'll send an adapter, free of
charge. Not all of the TNCs exhibit the problem, and recent
revs of the TNC boards already have the mod (which inverts
the phase of a clock signal) in place, so don't bother
unless you are actually noticing degradation of the modem
performance.

I am looking for someone who is very familiar
with the PK-232 Multimode box. I have been
reading the technical reference manual with
the intentions of retuning the Narrow band
transmitters and receivers to run 850 Hz
TTY shifts. I am not going to cannibalize the
1000 HZ Wide shift circuits, because I still
hope to run VHF packet. Hoping that I am
not a pioneer in this endeavour, I am looking
for advice from anyone who has been down this
path already.

hardie
From: hardie@dvinci.USask.CA (Peter Hardie)
Newsgroups: rec.ham-radio.packet
Subject: VE3IWJ KAM Mod.
Message-ID: <1921@dvinci.USask.CA>
Date: 27 Mar 89 20:25:27 GMT
Organization: University of Saskatchewan
Lines: 33
Posted: Mon Mar 27 21:25:27 1989

I installed the VE3IWJ change to R47 in the KAM by just paralleling a 22K
resistor across R47. My experience has been that it does not significantly
improve performance under good conditions and if the band is fading a bit
then it degrades performance. If, for example, a station sends you 4 packets
in one transmission and you receive the first one or two packets at which
point the band fades out and carrier detect drops momentarily, then the KAM
will transmit an acknowledgement while the transmitting end is still sending
packets 3 and 4. I just removed the mod but perhaps a somewhat larger value
than 22K might help out.
I am still having the problem I posted before which is that on a busy channel
the KAM takes an inordinate amount of time to retry an unacknowledged packet.
If for example I send a packet and the other end does not reply, then if the
channel is busy it can take as much as 30 seconds before the KAM tries to send
the packet again and if the other end never sees the retries then with my
RETRY=7 and FRACK=2 (AND PERSIST=255!!) it can take the KAM 5 minutes before

it gives up. By that time though the other end may have already timed out and called the next BBS (some of them only wait 2 minutes or so). I have had replies to my previous query from 3 people (sorry I don't have names/calls here right now) one of whom thought I had set PERSIST very low (hardly likely OM!) and two from Europe who both have the same problem. I've also had reports from two US sysops that they've given up on their KAM altogether and got a PK232 so their BBS can do something useful.
Now, I know there are others out there using a KAM (perhaps?) and if you are not having this problem I'd like to know what your KAM parameters are set at. I find it hard to believe that more or less default parameters make the box totally useless on a busy channel (BTW one of the European ops said the same problem exists with the KAM on VHF too!)
ANY ideas???
Tnx + 73

I read with great interest the articles regarding trouble with some of the ham radio dealers. What I did not see were any attempts to contact the OWNER(S) of the store or chain of stores. I have a few suggestions on this area which will probably lead to more satisfied customers.

If you go to a ham radio shop and receive gruff rude treatment or you were just plain ignored, or you feel that you have been mis-treated in any way, try talking to the store/branch manager. If that doesn't work, WRITE OR CALL THE OWNER ! THEY WANT TO KNOW THIS STUFF. Most of the time you can find their name(s) in adds in any of the major ham magazines. The owners usually want to make it right and will in most cases go out of their way to help you resolve a problem. Give them a try. Make sure you have the info regarding the "incident" handy such as day, date, time, person you dealt with, etc. They really do want your business

and do want to help.

    As far as returns of radios that are broken, all of the dealers that I do business with will take back an out-of-the-box bad radio within a few days, some more than that. If you wonder about that, ASK UP FRONT. If they say NO, then try to buy elsewhere. Also, a lot of the dealers will try to match prices of other dealers. If you see a cheaper price somewhere else bring in the add with you and ask if they will match the price or do better on their prices. If not then you can always go somewhere else. That is the Amercan way ! Any time you buy anything you should have your questions answered up front so you can make a intelligent decision.

Subject: KAM vs. PK232

The PK-232 was easy to hook up to the Kenwood 440. I used the RCA AFSK input and output jacks and used the "remote" plug (the one designed to be plugged into the linear) for push-to-talk. The right way to do this is to use the 13 pin data plug (which I just got some of). This allows you to mute the microphone jack on the front as well. You just run the PTT and audio lines from the 5 pin thing on the back of the 232 to the 440.

There are however two problems. First, the 232 ought to have a separate AFSK out level for the two radio jacks on it. We had to grossly change the Mic gain on the 2M rig to make it match the 440 FSK in. We also had to add a little cap across the 5 pin plug to keep stray RF from holding PTT down.

       Subject: Packet proposed for shuttle
```

Heath Company recently donated three HK-21 pocket packet TNC's to the NASA Johnson Space Center Amateur Radio Club in Houston. As part of the Shuttle Amateur Radio EXperiment (SAREX), it is proposed that an HK-21 be used on a March 1990 shuttle flight.

In this experiment, amateur radio frequencies will be used to transmit packetized data to and from the shuttle.

If the project is approved, one of the TNC's will be specially adapted for space travel. Nasa will mount it into a protective SAREX casing and modifications will be made for use in zero gravity.

You are welcome! I'm glad people are starting to get use out of it. (One of these days, I'll get the data transferred to my PC at home, and **I'll** get to use it! half :-). It is amazing to me how I still get calls based on some of those first announcements! Just last week I got a call from someone hearing about it for the first time, from a message about 3 months old! Ah, the vagarities of news....

I understand that there is another callsign server out east somewhere, and there is a 'company-private' callsign server here in Colorado. Then there was the person who made a list of all local hams whose licenses were about to expire. He contacted everybody on the list and reminded them to renew. Some people had totally forgotten about it, and were very thankful.

I have also heard from a few people who are basically waiting to get enough room on their disks to hold it all!

-----(and the ham callsign project goes on! for info, ask:)-------

Date: 04 Mar 89 15:39:34 edt (Sat)
From: k2jov@n2elc.ampr.org (Harry)
Subject: KENWOOD TH-215A TO TNC

THE HOOK-UP OF A TH-215A TO MY PAC-COMM TINY 2 TNC WAS VERY EASY. THERE ARE NO COMPONENTS INVOLVED IN THE CONNECTION. ALL YOU NEED ARE TWO PHONE PLUGS: 1 SUB MINI, AND 1 STEREO(3 CONDUCTOR) MINI. BOTH AVAILABLE FROM RADIO SHACK,TWO TO A PACK. IF YOU HAVE A KENWOOD SPEAKER MIKE, THEN THE INSTRUCTION SHEET WILL CONTAIN A DR AWING SHOWING THE BASIC CONNECTING LINES. IF NOT, HERES HOW ITS DONE: THE SUB-MINI IS THE SPEAKER PLUG. THE CENTER PIN GOES TO THE SPEAKER PIN ON THE 5 PIN DIN ON THE TNC, THE SHAFT IS THE GROUND.

ON THE MINI STEREO PLUG, YOU DONT USE THE CENTER PIN, JUST THE TWO SHAFT CONNECTIONS. THE SHORT SHAFT GOES TO MIKE, THE LONG SHAFT IS THE PUSH TO TALK......THATS IT, FOUR WIRES TO THE CONNECTOR THAT GOES TO THE TNC PLUG, AND YOURE IN BUSINESS!!

ONE VERY VERY IMPORTANT THING-----ALWAYS MAKE SURE THAT ALL BATTERY SAVE FUNCTIONS ON THE HANDY TALKIE ARE OFF. IF IT ISNT, A SLIGHT DELAY IN RECEIVING WILL CAUSE RETRYS FROM THE STATION SENDING TO YOU, AND WILL DELAY PACKET RECEPTION AT YOUR END. PLEASE AKE CAREFUL NOTE OF THIS. ANY QUESTIONS, REPLY TO K2JOV, HARRY, AT N2ELC-4 BBS IN N.J......GOOD LUCK!! 1450z, 463 msgs, #25850 last @KD6TH-4 MailBox>

Subject: Paccomm Tiny-2 Factory Mod

Here is the "Factory" fix for Pac-Comm Tiny-2's & Micro-Power 2's that have become hard of hearing. It seems that Pac-Comm has some boards out that work fine when new, but with age the tnc requires a huge amount of Audio input from the speaker jack or it won't decode properly. They are lost as to what is deterioating in the boards but offer this fix to its customers.
It is quite simple and very neat, all parts are mounted on the under-
side of a 16 pin IC socket, the Modem chip TCM3105 (U16) is removed,
the modified socket is inserted into existing socket on TNC's

board,
and the modem chip is re-installed.

Parts Needed:
1 - 16 pin IC socket
1 - 2222 Transistor NPN (EGC 123AP)
2 - 10000 ohm 5% resistors (brown-black-orange-gold)

Instructions:
 Solder 1 resistor to Emitter, other end of resistor to pin 12
  Solder 1 resistor to Base, other end to pin 2
   Solder collector to pin 5
   >EndFile<

Note: I have not tested or verified this mod, proceed at your own risk.
WA2ISE

     Just wondered How many ppl out there are members or officers of
     Radio Clubs that are associated with a College or University.
     I have the idea of starting another discussion that relates
     some of the problems, joys etc. of College Ham Radio. If you
     Think this sounds interesting please drop me a note so I can
     see what kind of interest there is. Topics could include
     University Funding, Purchase of Equip, Contest, College
     Problems, etc.

     send e-mail to Thrifty @ MTUS5
     or via Packet to N8JKQ @ WB8Q
     or call 906 487-0492
                                     Thanks Jim

1989 TAPR meeting notes, part 2 of 2

Date: Fri, 10 Mar 1989 01:59 MST
From: Keith Petersen <w8sdz@WSMR-SIMTEL20.ARMY.MIL>
Subject: 1989 TAPR meeting notes, part 2 of 2

This is part two of two postings which make up the meeting notes from the 1989 TAPR annual meeting which was held on Saturday and Sunday February 25 and 26, 1989, in Tucson, Arizona.

Each posting has cut lines so readers can piece the two together to recreate the original file, TAPR89.TXT.

---cut-here---PART TWO OF TWO---cut-here---
Mike Lamb, N7ML: No-Code License

After lunch, Mike Lamb, N7ML, of AEA spoke about the code-free license proposal. Lamb is on the ARRL committee to study the possibility of proposing a no-code license to the FCC. He pointed out that the early days of packet radio were marked by not only technical accomplishments, but also impressive salesmanship by the likes of Pete Eaton. He asked if TAPR members would be willing to act as salesmen for a no-code proposal; 15 to 20 hands were raised. Lamb pointed out that six MHz of spectrum at 800 MHz was estimated by the FCC to be worth $1,200,000,000, and that the amateur UHF-and-up spectrum is extremely valuable to commercial interests. He stated that bands like 902-928 MHz will be as important to the Amateur Radio Service in a few years as 144-148 MHz is now, and that we should seek to populate these bands now to avoid losing them to commercial interests.

Bdale Garbee, N3EUA: N6GN 1200 MHz Transverter

Bdale Garbee, N3EUA, had several projects to discuss. The WA4DSY 56 kbps modems have a 28 MHz IF interface, and thus require a transverter to 220 MHz or higher. These transverters are quite expensive and not very available. Also, spectrum space on 220 and 450 MHz is scarce. To solve this problem, N6GN is working on a transverter from 28 MHz to 1200 MHz for use with the DSY modems. Spectrum is still available on 1200 MHz, omnidirectional antennas are practical, and Japanese RF building blocks are available inexpensively. The design can also be used at 900 MHz. The N6GN design, which is currently in prototype, provides 1 watt

or 18 watts if a final Mitsubishi brick is installed. It has either a 28 MHz or a 144 MHz IF, permitting use with the DSY modems or with a 2m satellite station. It provides fast T/R switching using PIN diodes, and can be run full duplex by splitting the LO. The materials cost is estimated at $150 to $200. Garbee asks that potential users of this design contact him with comments.

Bdale Garbee, N3EUA: Microwave Ethernet

Garbee is also working on a project to use 10 GHz or 24 GHz Gunn diode transceivers designed for police radar applications to transmit very high speed data. He uses standard Ethernet transceiver chips with the clock oscillator modified to produce 2.4 Mbps instead of the usual 10 Mbps. The reduced rate is necessary to permit use of a Motorola FSK demodulator chip on the receive side. He has a prototype working on the bench at 2.4 Mbps. Operational concerns include stability over temperature and the validity of current path performance predictions. Garbee estimates that a 2 Mbps half-duplex system can be built for around $200, plus the cost of the computer and Ethernet interface card.

Bdale Garbee, N3EUA: KA9Q NET Release

Garbee is also handling the release of KA9Q's NET software. One final release of the current (122587.33 derived) software is planned before the initial release of KA9Q's new NOS NET. This last release will contain many changes submitted by many individuals. Garbee has been receiving about 100 electronic mail messages per day, about one third of which contain code fragments. Several HP and Apollo technical writers have volunteered to update and enhance the user documentation for the package. Garbee was unwilling to commit to a schedule for the release, but admitted that late March was a possibility.

Mike Chepponis, K3MC: Awesome I/O Board

Mike Chepponis, K3MC, described his development of the "Awesome I/O Board". The board is a smart I/O controller designed to plug into a slot on an IBM PC or AT computer. It contains an 85C30 serial communications controller chip, connected by four DMA channels to an onboard NEC V40 processor running at 8 MHz. The 85C30 provides two full-duplex channels. The V40 shares 8K or 32K of dual-ported RAM with the host PC via the 8-bit XT bus. Chepponis displayed a wirewrap "not quite working" prototype board.

Chepponis described two other configurations for similar designs. In one, the V40 stood alone with its own ROM and RAM, and was connected to multiple 85C30 SCC's. One SCC was connected for DMA and used for a high-speed channel, and the others were connected for interrupt-driven I/O and used for low and medium speed

channels. In a second configuration, a stand-alone V40 was connected to a single 85C30 for DMA. One channel of the V40 is used for high-speed communications, and the other channel is connected to a Macintosh host computer's Appletalk network port.

Chepponis listed a few of the applications he envisions for high data rate packet radio. At 56 kbps, "instant" mail delivery, six TDM digital voice signals, FAX at less than 10 seconds per page, digital SSTV, and multiperson realtime interactive services such as remote schematic drawing become possible. At 2.0 Mbps, file servers, compressed fast scan TV, 200 TDM digital voice signals, and various picture formats (even animated) are possible.

Chepponis compared the cost of a conventional 1200 bps packet station ($1000) to that of a 56 kbps packet station using his I/O board ($1700). In terms of bits/second/dollar, the 56 kbps station is about 25 times more cost effective.

Phil Karn, KA9Q: WA4DSY 56 kbps Modem

Phil Karn, KA9Q, took the podium again to discuss the design of the WA4DSY 56 kbps modem. He stated that this modem is not well-known in the amateur community. He has a network of three DSY modems working on 220 MHz in northern New Jersey. The DSY modem uses a modified form of MSK (minimum shift keying). In terms of phasor diagrams, MSK can be understood as a vector that rotates 90 degrees every bit time, at a constant amplitude and phase velocity. Thus, it traces out the unit circle on the phasor diagram. This modulation scheme has a constant envelope, but a wide spectrum. The DSY modem achieves a narrower spectrum by having the phasor cut the corners of the unit circle, tracing out a diamond on the phasor diagram. This results in sinusoidal phase velocity, and a non-constant envelope. The DSY modem generates a signal about 74 kHz wide at 56 kbps, or plus and minus 14 kHz deviation.

The DSY modem consists of three circuit boards, available from GRAPES. The Transmit Encoder board contains a clock generator, data scrambler (to remove any low-frequency or DC components from the data), and a state machine waveform lookup table driving two DACs. The DAC outputs form the I and Q channel signals, which are lowpass filtered and passed to the Modem board. The modulator consists of a standard I/Q modulator with a 0 dBm 28 MHz output and a receive chain based on a Motorola 3357 FM IF chip with a crystal controlled LO. The analog baseband data is sent to the Receive Decoder board, where a slicer and descrambler recovers the data and a PLL recovers the clock.

Karn stated that he is a big fan of the DSY modem. He beleives that the user stations should be operating at least 56 kbps. The channel access problem is critical. He recommends crossband full duplex operation, so that collisions may be detected and aborted.

Dan Morrison, KV7B: Modem Comparison

Dan Morrison, KV7B, described his experiments in collaboration with Eric Gustafson, N7CL, comparing a phase detection demodulator for FSK with a simple filter demodulator. Their goal is to better understand how HF packet works and how to improve performance of HF modems. They used a Kenwood TS-440S and a Dalanco Spry DSP board together with a beta-test DSP signal analysis software package running on a PC. They used the DSP software to simulate the two demodulators.

Morrison showed several graphs of power versus frequency that show a discrepancy between the theoretical power spectrum for random data and the spectrum of actual packet data. The actual spectrum shows an additional peak in the center of the main lobe, which Morrison attributes to the HDLC bit stuffing.

Morrison modeled a naive discriminator, having a linear response over the frequency range of interest. This demod performed very poorly. Then he modeled a filter demod, whose graph resembles that of the discriminator to some extent. Integrating the frequency response of the filter demod results in a curve that matches the spectrum of the signal fairly well; a perfect match would imply an optimal demodulator. This demod generates good eye patterns. Next, he added limiters to the filter demod. Filters have a reputation as the bane of HF demodulator performance. It still generated good eye patterns. He then added noise, and still got good eye patterns. He concludes that the filter demod works just about as well as the phase detection demod as long as the signal is bandlimited before the demodulator.

Morrison presented a graph of a signal before and during a severe multipath fade. The attenuation of one tone was clearly visible. These signals were demodulated, and both demods did well as long as the envelope of the signal was above the noise level. A member of the audience asked "why not demodulate just one tone?", and Morrison replied "That won't work very well. What if the multipath fade took out the tone you were demodulating?". Tom Clark, W3IWI, stated that the conceptual model of "tones" was a poor one for modulations with bit rates about as big as the shift. Perhaps the incidental amplitude modulation caused by selective fading could be used by a sufficiently smart demodulator.

Morrison then presented graphs of eye patterns for a very noisy signal received with a 2.4 kHz SSB filter. This generated a hopelessly bad eye pattern on the phase demod, and a pretty good eye pattern on the filter demod. This is a result of the narrower frequency response of the filter demod. Narrowing the input filtering to the phase demod to 500 Hz produced similar performance to that of the filter demod. Morrison concluded that a well-designed filter demod works very much like an ideal

noncoherent demodulator. Either modem needs a narrow bandpass filter before its first nonlinear stage for good performance.

A member of the audience asked if increasing the shift from 200 Hz to 600 Hz would help performance. His intuition was that it would. Morrison stated that it would not, and Clark agreed. Both had run experiments verifying their conclusions.

Eric Gustafson, N7CL: TAPR Hardware Projects

Eric Gustafson, N7CL, described three new developments from TAPR's hardware designers. Two of them are tiny circuit boards designed to improve the DCD performance of a TNC's demodulator. These circuits were described in the last Networking Conference proceedings. One is for a TNC-2, and the other is for AM7910 based modems. The other new development is a hardware upgrade path for TNC-1 owners. This board piggybacks on the TNC-1 board and permits the TNC-1 to run TNC-2 firmware. This allows TNC-1 owners to keep up with the evolution of TNC firmware, even though TNC-1 firmware updates have not appeared. None of these items are priced or available yet.

Gustafson described the prioritized ACK proposed modification to the AX.25 Level 2 protocol. He stated that code implementing this version of the protocol for TNC-2 will be available for testing on TOMCAT and CompuServe soon. The code is based on TAPR version 1.1.6.

Jim Vogler, WA7CJO: 10 GHz EME

Jim Vogler, WA7CJO, was introduced by coworker Tom Clark, W3IWI. Vogler was the first to succeed at 10 GHz EME. He showed us pictures of his EME station. He has a 15' dish with a moving mass of one ton and a half-power beamwidth of 0.5 degrees. He points the antenna at the moon by listening for the noise reflected from it at 10 GHz, and tracks by means of a video camera mounted on the edge of the dish. He can control antenna pointing to 30 seconds of arc, and frequency to a few hundred Hertz. He uses a surplus 100W TWT amplifier with a scalar ring feed for about 20 MW EIRP. The TWT beam was defocused, so he used permanent magnets to refocus the beam. He was able to hear his echoes from the moon with 15-20 dB S/N.

Vogler said a few words about the problems of creating a power amplifier for 1.2 MHz and up. Transistors for 20W at 1.2 GHz are $50 and falling. Amplifiers can be built, but commercial ones are very costly. Kits can be a problem, since considerable test equipment is required to align the amplifier, and mistakes that destroy the device are costly.

Jon Bloom, KE3Z: ARRL and Packet

The STA authorizing automatic control of certain stations on HF

has been renewed for another year. The League hopes to have a permanent rules change in place by the time it expires. The Digital Committee and Membership Services Committee will examine the results of the testing and propose new rules.

ARRL has established a Technology Grants program, whereby developers of amateur radio technology can apply for funding from the League. This is partially a result of Paul Rinaldo, W4RI, pushing for improved HF modems and protocols.

Expect a MicroSat article in an upcoming issue of QST.

TNC's are being integrated with the SAREX transceivers in anticipation of the next ham in space, schedule for STS-35 in spring of 1990. The request for prioritization has been submitted to NASA HQ for the experiment.

TAPR Business Meeting

President Andy Freeborn, N0CCZ, resumed the chair and conducted the annual business meeting. He gave a summary of the year's activities. The office complex was closed, and Chris the office manager now operates the TAPR office from her home. TAPR had no booth at Dayton '88, but has requested a double booth in the new wing for Dayton '89. A rewrite of the TAPR Bylaws is in progress. The DSP Project is now an official joint project of TAPR and AMSAT. The two organizations will share the risks and benefits fully. Two AT-type computers outfitted for CAD work were purchased to support hardware design efforts. They are presently in use in Tucson and St. Louis. TAPR has contributed $21,300 for Pacsat/NA hardware, and is serving as the procuring agency for all Pacsat hardware purchases.

PSR Editor Scott Loftesness, W3VS, has announced his intention to retire at the end of the calendar year. A new volunteer is sought. TNC-2 licensing fee income will be ending soon. A new project is necessary to provide a source of income. The Board has been in continuous session via CompuServe HamNet during the year; nine votes were taken during that time. An income statement and balance sheet were presented. With an income of about $61000, the total assets and liabilities of the organization are $122,500.

A question and answer period followed. One member stated that the Board should keep the membership better informed about its day to day activities, and there was general agreement. A member asked about the status of the DSP project. W3IWI answered that Bob McGwier, N4HY, has been writing software for the Dalanco-Spry development system, including several new demodulators. Since there is no prototype hardware in the final configuration yet, he has not begun porting the software to the target system. W3IWI guessed that late summer would be earliest possible availability. The V40 hardware has been designed, but layout has not begun.

The other boards are being fabricated in a prototype version. They have had problems finding satisfactory CAD software for PWB layout. There may be a problem with the V40 chip and interrupts. It appears that TAPR is standardizing on the V40; this is important so that we can build up a base of knowledge about its quirks. The DSP Project is personnel-limited; more qualified volunteers would be welcome.

Another member asked if the DSP Project was the only new development under way. Freeborn answered that there was another project in the early design stages: a 9600 baud VHF radio/modem. This project was mentioned briefly in PSR. TAPR is wary of announcing products before they become real, so they try not to make a lot of noise about a project this early in the design phase.

Pete Eaton, WB9FLW, led the membership in thanking Andy Freeborn, N0CCZ, for his outstanding efforts in the past year in reorganizing the organization. Applause.

The meeting was adjourned for the day at 5:15 PM.

An additional session was held on Sunday morning, with a single agenda item: the no-code license proposal. Harold Price, NK6K, led the discussion. He has been charged, along with other committee members, with creating a concrete proposal of some sort to provide to the ARRL committee. The discussion proceeded in stages: opening remarks, purposes, and specifics. An appropriate background was provided by sounds of hymn-singing from the church service being held next door.

Your reporter will not attempt to reproduce all the arguments presented in this 3-hour discussion. Though the discussion remained intelligent and civil for the most part, there were diverging opinions. The following represents an attempt to summarize the semi-consensus that evolved during the meeting.

TAPR's purpose in getting involved in the issue in the first place is to help the ARRL to lead the amateur community to accept some proposal. Last time no-code came up, the proposal was violently opposed by a large fraction of the community. The ARRL, being a political organization, will be reluctant to reverse this position unless it believes there is significant support for the proposal in the community. By presenting a workable proposal and standing behind it, TAPR may be able to encourage ARRL leadership to try again.

Our purpose in seeking a license that does not require Morse Code proficiency is threefold:

1. To ensure that crucial spectrum allocations in VHF and up are utilized and remain available to the Amateur Radio Service,

2. To lure more technically competent people into Amateur Radio, and

3. To lure more young people into Amateur Radio to ensure the future of the Service.

The specific proposal should have the following characteristics:

o The existing licensing structure remains as it is. No privileges will be given to or taken from any existing licensee. To do so would be to invite controversy.

o An addition licensing structure consisting of two license classes would be added. These classes would grant operating privileges above 30 MHz only. One license would be fairly easy to obtain, with a written exam similar in difficulty to the Technician exam. This license would have very limited privileges. The licensee might be prohibited from controlling repeaters, homebrewing transmitters, or operating high power; and/or the license could be made nonrenewable. The license would be limited to selected bands or subbands. The other license would be difficult to obtain, with a written exam more difficult than any now in use. This license would have full amateur privileges above 30 MHz.

The group was unable to agree on the specifics of the restrictions to be placed on the beginning license class, or even on an appropriate name for it, in the time available. The Board's committee is charged with fleshing out the proposal based on the opinions stated during the meeting. At the end of the discussion, Freeborn asked how many opinions had been changed by the arguments. Several people in the anti-no-code and uncommitted camps admitted to being swayed toward no-code by the arguments they had heard.

The TAPR Annual Meeting was adjourned at 12:28 PM.

Subject: KAM vs. PK232

From article <977@necis.UUCP>, by rbono@necis.UUCP (Rich Bono):
>   I have been VERY happy with the TNC's... they work.. have many
> useful features.. are compatible with software... and DON'T look like they
> were thrown together in someones garage/basement workshop! Plus, Kantronix
> is very responsive to users as far as improving their software, and adding
> many features.. which they "give" to the users for a little over the cost
> of the ROMs themselves.. (ie: ROM update for KAM 27C512, $15)

Your mileage may vary. Although Kantronics has been gung ho over adding
software bells and whistles, some of which are of dubious value to the
packet community as a whole, they have been less responsive concerning
certain technical problems. A number of KPC users have experienced
problems, apparently related to flow control bugs, when trying to do binary
file transfers or run certain BBS software, and I gather that Kantronics
was not much interested in helping solve the problem. Kantronics is also
notorious for selling TNCs that have NO watchdog timer, causing numerous
instances of TNCs glitching and jamming packet frequencies for hours
(probably melting down a few rigs too :-). I certainly hope they have at
least discontinued that practice.

From: Tom Anna <IBTUSM02%CZHETH1I.BITNET@CUNYVM.CUNY.EDU>
Subject: Receiving packet w/o TNC

There was a discussion lately, if a packet radio station without TNC is
possible. Several good reasons were quoted, that it can not be done.

Why not do it ALL in software ? Hardware requirements: 1 A/D converter
8 bit / 8kHz, a little buffer RAM, and some TTL stuff, all together on
a small PC plug in card. This card digitizes the audio signal from the
receiver in a CD player style, and makes it accessible to the computer.

Software: Some digital filtering, a demodulator and a packet disassembler.
If you sample the audio signal with 8K samples/sec, there is 125 mikro-
seconds CPU time per sample: This should be enough for these tasks.

Only by software changes you could also receive RTTY/AMTOR/SSTV/weather ...
With little extra hardware you might also transmit all these modes.

Before I start programming this, has anybody begun/completed it already ?
Comments welcome. Further details on request.

Subject: Setting up TCP/IP

We are (finally!) trying to get some TCP/IP activity on air here
in OH-land and a couple of questions have arised. I hope you
there with more practicat experience can help:

Most configuration exaples and address-lists still seem to use
domain names of style user@oh2bqz.ampr . However, I understand
that SRI-NIC has registered ampr.org domain for amateur use, so
we should that one? Any points on that?

I have tried to find out a good gateway between SMTP and MBL-bbs.
So far there seem to be three possible solutions: SERVER, PXX and
changing to W0RLI software. PXX lacks the abitity to force the
decired PID on a message. With server you must always address
your mail to user server and add extra lines in the beginning
of message. Server always sets the sender-field to "server",
not so nice. W0RLI has no provision to have bulletins sent from
SMTP side? There are rumors that AA4RE would have SMTP support
in future releases, has anybody heard of Jeff?

Still it seems to me that using SERVER would be the best choise
for now (if you want to have bulletins sent from SMTP). Have I
missed something?

From: brian@ucsd.edu (Brian Kantor)
Subject: Setting up TCP/IP

The official domain is 'ampr.org'. Hostnames are therefore

    wb6cyt.ampr.org

```
    nsf-gw.ampr.org
    sun.ka9q.ampr.org

etc., etc.  But because you may omit the common upper hierarchy of a
domain when you are within that domain, these simplify to just

    wb6cyt
    nsf-gw
    sun.ka9q

for most amateurs.  I'd suggest using the unqualified names on the
air and in hosts.net files, and let the mail gateways take care of
adding the full qualification to the name when necessary.

I don't know who started the 'wb6cyt.ampr' custom; it's not very useful
and it's not very correct.  I think we should stomp on it.

>on a DSP version of a modem for our favorite hobby. Does any one know what it
>is when it will be done, are samples/kits going to be available?

The latest word is that most of the folks working on the modem (e.g.
Bob N4HY, Tom W3IWI, etc.) are very busy working on the PACSATS to get
them ready for the launch early this summer.

By the way, the rumor is that the 56K DSP parts (which won't be used in the
first release of the DSP platform) will be <$15/per by the end of the year.
Perhaps they should look closer at those parts and skip the TMS320s all
together? :)

Subject: Headend Frequency Translators and packet

>Phil, what do you feel are the advantages of the linear crossband translator
>as opposed to the more traditional approach of using a WA4DSY modem as a bit
>regenerator in a crossband full-duplex repeater?

I was originally thinking along the lines of the bit regenerator too. What changed my mind was a back-of-the-envelope performance analysis based the keyup delay of the WA4DSY design (15-20 millisec). This delay has emerged as the single largest item of channel overhead, protocol headers included. Even without the extra delay of a regenerator, the keyup delay for a single-packet transmission represents almost FOUR TIMES the overhead of the TCP/IP header certain unnamed people thought was "too large" for amateur use. (TCP/IP headers are 40 bytes; 20 millisec at 56kbps is 140 bytes. I'm presently using a keyup delay of 150 byte times on our 220.55 MHz simplex frequency for a little extra margin).

An even more important reason to minimize repeater delay is that it strongly affects the probability of collisions and hence the efficiency of the channel under heavy load. Look at Bogg's graphs of Ethernet efficiency as a function of load and packet size. When the packets get small in relation to the propagation delay, efficiency under load drops off. Now, "propagation delay" in this context is the amount of time it takes for everyone to recognize (and defer to) a transmission on the channel; it is the sum of the cable or RF propagation delay and the modulator keyup/demod lockup times. Unlike 10 Mb Ethernet, RF propagation delay in our case is nil (in a single bit time at 56kbps, light travels 5.35 km, coincidentally just about the distance from my house to our proposed repater site). But the effective "propagation delay" of a repeater that took 20 msec to recognize and repeat the leading edge of a packet would be almost 6,000 km. The delay of a linear translator will be on the order of the reciprocal of the filter bandwidth (1/100Khz = 10 uS or so -- similar to the RF propagation delay and therefore negligible).

In a local environment, I do not expect the S/N levels to be low enough to give regeneration much of a compensating advantage.

I will be looking at the design of the WA4DSY modem to see if the keyup delays can be improved. I know Dale made the transmitter half-duplex out of fear of QRMing the receiver, but it has been my experience that the halves are well enough isolated even when operating on the same IF that this isn't a problem. Apparently much of the delay is in starting the various crystal oscillators in the transmitter, and these could be run continuously.

Phil

Subject: KISS TNC Construction Project.

PE1CHL did a nice Z8530 interface for the Atari that will be supported in the upcoming version of NET.

The Mac has an 8530 built in already, so hack together a modem and go for it.

I've never messed with an Amiga, but it shouldn't be any harder to build an 8530 interface for it than to build a TNC, and you'd have a nicer result.

Bdale, N3EUA

From: hpfcdc!hpldola!hp-lsd!hp-col!bdale@hplabs.hp.com (Bdale Garbee)
Subject: KISS TNC Construction Project.

>I guess one could use a smaller EPROM, say 32 kbit.

KISS will fit fine in a 2716... near as I can remember.

>I cannot really see in what way a dedicated KISS TNC (with an RS232
>interface) would be cheaper or easier to build.

I think you are correct. By far the most expense is in the sheet metal and actual PC board, the rest of the components are fairly trivial. Far better to spend our design time doing nice Z8530 interfaces for the few remaining popular machines that don't have them...

Bdale, N3EUA

Subject: TAPR DSP?

>I have been hearing very little about the current TAPR project that is working
>on a DSP version of a modem for our favorite hobby.

It's coming, but slowly. A big problem is that it's the same folks working on the DSP project that are working on the current AMSAT microsat project... for the most part. The good news is that there's some commonality in some of the digital hardware, so some problems that are being found in the AMSAT designs will get corrected before they get commited to PCB's in the DSP project, the bad news is that the going is slow.

I'm not closely enough in touch with the actual project to comment much
further.

Subject: Directory Service Standardization

Hi guys,
I have been watching all kinds of non-discussions of WP and other directory servers and thought it might be nice to ask you folks who may or may not be on this list, or who may or may not be on CompuServe to get involved with a project which needs doing:

standardization of data elements and system/user services for a directory service. I have enclosed some messages that went out to CIS tonight in order to give you some background. Anyone who has any ideas for this project pipe up after you read these messages.
73,
Gordon Beattie, N2DSY

To: eric williams WD6CMU 71336,1424

WD6CMU, VE3GYQ, W0RLI, WA7MBL, KA2BQE, K3RLI, etc...

Are you guys (or others) interested in defining minimum functional set of data elements and system/user services for an Amateur Radio directory service? We would greatly benefit from a public discussion of such a system and would help remove some of the operational hassles if we stop and plan a bit. No one is saying that the systems will be the same, but simply interoperable.

My preference is for data elements which can be found in CCITT X.500 Directory Services. I would like to see a data set whereby a system which did not support all elements would at least carry them without discarding the unsupported data. (Not a bad idea for mail either...) After this first step we can look into a common set of services or functions.

Why don't we all get our heads together and agree on something that will work for the Amateur Community while also providing

for the individual preferences of each developer/user community. I will be finishing up the promised message header elements shortly and with it I can have a draft set of directory data elements. Interested? What say? 73, Gordon

Dave,
   Thanks for the info...It seems that there is a perception that the WP protocol or plan is a secret...at least that's what I saw here...could you tell us more? Our plan is to implement a server based on the CCITT X.500 Directory Service. Maybe through some exchange of ideas we can agree on a common set of interoperable user/system services for our systems. We would also be interested in interoperation with other directories. Our objective is not really directed at the user, but also systems and services as directory entries. Your thoughts? 73, Gordon

#: 93900 S9/Packet Radio
    16-Mar-89 02:24:36
Sb: #93800-Error in CONFIG.MB
Fm: J. G. Beattie, Jr. N2DSY 72417,652
To: eric williams WD6CMU 71336,1424

Eric,
   maybe I am a bit confused...are you the creator of WP? If you are then what is Dave, VE3GYQ doing with W0RLI? I was looking at your discussion of data elements and I would think that Name searches are reasonable. I am waiting for Rusty Carruth's database of callbook data and for another disk. All in all we should not really limit our perspective on what is useful (that is somewhat subjective) when picking data elements. We should however limit ourselves to practical database sizes (again somewhat subjective, but more reasonable). I would like to see what data elements you keep in your system and add those into my list (pretty much everything in the Objects and Attributes section of X.500) with a few notable additions like Callsign, affiliations, appointments, and a few tweaks, like refining defined data elements for Amateur Radio purposes. So when do you think you could send me a list of data elements? 73, Gordon

Dear Brian,
You might want to have a look at PMODEM from WB6YMH (Skip Hansen). I know it works with MS-DOS machines running Procomm or some such on packet. It is a packet version of YMODEM that Skip put together some time ago to do binary transfers on packet. His source is available, so you could compile it on your machine and mess around til it works or you give up and take up snail racing instead.

        WB6YMH is good in the call book, also you can dial into his sys and grab all you want via landline. Phone is: (213) 541-2503

        You might also consider using net (NET.EXE) and doing TCP/IP. I sometimes get ka9q's net running on my Unix 3b1. Certainly less nerve wracking than PMODEM.

Yours

>   [further details on the translator design omitted]
>
Phil, what do you feel are the advantages of the linear crossband translator as opposed to the more traditional approach of using a WA4DSY modem as a bit regenerator in a crossband full-duplex repeater? I guess that the cost would be fairly similar. At first glance, however, the ability to translate ANY analog signals rather than just the 56 kbs MSK emissions strikes me as more

of a bug than a feature... I suppose it might come in handy in emergencies
'n such. Also, the lack of regeneration makes the link margins lower.

We've just begun a project here to set up a 56 kbs LAN using some combination
of 220/440/902 MHz, so I'd be very interested in hearing more of your thoughts
on the design philosophy.

From: aero!trwind!bgun@oberon.usc.edu (Bill Gunshannon)
Subject: KISS TNC Construction Project.

At this point I am not sure I understand what is being asked for.

I am currently running a TNC2 (among others) with KISS EPROMS
and I don't see where anything else is removable from a practical
stand point. The TNC costs right around $100 and the proms can be
gotten from a numbert of sources in some cases even free.
Based on this I don't see how anyone could manufacture a TNC for
KISS that would be any cheaper than what is available now.

Maybe a better explanation of the problem is called for.

From: encore!necis!rbono@bu-cs.bu.edu (Rich Bono)
Subject: Version 1.8 of DOSGATE available...

For those that have been following the DOSGATE project,

    I Have a new version of the DOSGATE driver available (version 1.8).
Changes have been made in the parsing of the CONNECT message from the TNC.
This is to allow DOSGATE to work with a wider range of TNC's.

    If you would like the new version of the DOSGATE driver, contact
me. Or I could post to the NET here in the PACKET group.

    For those who did not receive the original posting of DOSGATE,
there is a copy availble at the archive site. DOSGATE is a device driver
that "opens the world" of computers to the packet network. It works with
standard AX.25 packet, and requires NO special software at the users end.

    This allows remote users to run applications via packet. This is
not "yet another BBS" application!!! There is NO limit to what can be
accomplished with the DOSGATE driver and packet radio... I leave it up to
your imagination....

have you had a look to the DIGICOM package ? All you need for it is a
separate modem. It will give you the features of a private BBS, through
connects with hop-to-hop-ACK for other stations, sophisticated remote
controll, comfortable file transfers etc etc.

After all it's available without charge.

>a problem. Apparently much of the delay is in starting the various crystal
>oscillators in the transmitter, and these could be run continuously.

I think I may have mislead some people with the term "half duplex". What
I *meant* to say was that the WA4DSY modem transmitter stops the crystal
oscillators (clock and RF carrier) when the RTS (Request to Send) input
line is brought inactive. Dale's intent here was to prevent possible QRM
to the receiver (which is a completely separate part of the modem) when
the two are configured to operate in a half-duplex mode on the same
frequency. Fortunately, the physical layout was done so well that it
seems this concern was largely unwarranted. You can even saw the RF
board into two halves (one TX, one RX) and put the modulator and
demodulator into separate shielded boxes if you want, but I haven't
found this to be necessary.

The problem I was alluding to was that the keyed transmit oscillators
are apparently the major components of the 15-20 ms keyup delay;
crystals are very high-Q devices. Some trivial modifications to the
modem would allow these oscillators to run continuously, with only the
transverter actually being keyed. I will be experimenting with these
approaches in the hope of getting the keyup delay down to the 5-10 ms

range, which I understand is the acquisition time of the clock recovery loop in the receiver. (Here there are some fundamental tradeoffs between acquisition time and weak-signal performance, so there's a limit to the turnaround speed of *any* modem.)

There is nothing inherently half-duplex about the WA4DSY modem design when configured to run on different transmit and receive frequencies. You can easily leave the RTS line to the transmitter up all the time and receive data at the same time. There are NO components that have to be switched between transmit and receive, so in this sense the modem is completely full-duplex.

Sorry for any confusion.

Phil

Subject: Where Can I get started... Beyond tnc-2

In article <27280@cci632.UUCP> cb@cci632.UUCP (Curtis Braun) writes:
>I've been reading about alternatives, etc to tnc's and ax.25 packet.
>This is most provocative. I am not familiar with the radio part
>of communications other than a frustrated usr of packet radio via
>a hd4040 tnc @1200baud. I KNOW that there is a better way...
Yes, there is. It's hard to think of a worse way, actually, than what's been done already! But let's break it down into the constituent problems.

>It seems to me that if a telebit modem can fly at some higher speeds,
>and that the telephone industries can do ISDN (they too need a better
>spec) than where can we go. Can't we do multidrop 9600+ communications
>like the telephony industry.

A valid question. The current use of 212 modem technology is totally absurd, but it stems from the "appliance operator" mentality. Ten years ago some VADGC pioneers had some surplus (already obsolete) telco 212s to play with; it's also dirt cheap to implement, and fits into the AF passband (mic filters and all) of commodity FM rigs. Direct FM would fit 9600 into the same 20 kHz channelization, but would need better modulators and receivers, and would need to bypass the audio stages. The Japanese rig builders don't do this, since their big market is still voice (and not the US, either). Hamtronics does, but their stuff is otherwise primitive (no synthesizer).

You can do 2400 or even 4800 thru an audio system into an FM rig, but it's not quite so tolerant of mistuning, wrong levels, etc. And the turn-around time becomes more significant -- with allthose relays chattering, shorter packet times get overtaken by T/R switching time. Again a packet-oriented rig (not a voice one) could fix that in a jif. Taz Inoue, where are you?

>Why can't a bbs feed be multidrop, then
>I won't have to "dial" ops "connect" to one, I'd have my mail on my
>BOX where it belongs.

That's an application problem; the TCP-IP world does it better,
and some BBSs are smarter than others. Again it's the appliance
attitude "gotta be MBL/RLI compatible" that holds people back.
There was a lot of flaming recently at the autthor of the TCP/IP
package's AX.25 mailbox subroutine, since it needed the user to hit
CR after connect. Too tough for the AX.25 users! (Gimme a break.)

>With the compression techniques like PKZIP's
>archiving program, why can't we incorporate it the scehme of things?
>I just heard of a program called flashlink which provides mnp 4 and
>mnp 5 additions to the standard modem interface (via software) to
>speed up the through put?

Most ham file transfers (on TCP/IP) use ARC or other compression
already. You only need to compress once; compression does however
make data integrity more important. TCP/IP can handle it.

>Why can't the actual packet size be variable
>for higher through put? Why can't we do full duplex communications
>on the radio, repeaters do it?

Packets are variable-size already, both AX.25 and TCP/IP.
Full duplex is very beneficial; a few packeteers do use it, but
it takes a repeater-pair and repeater to do it (duplexer needed),
and the FM voice boys have pretty much claimed the 2m and many
other repeater channels to themselves already. This is a big
problem; we do need to shake loose some repeaters! You then get
about 4 times the throughtput that you do from hdx digipeaters.
>As you can see I have a lot of questions,

Yes, and they're good ones! Ham packet radio is largely in a rut.
We need people to move on from the TNC/AX.25/BBS model into some
better things (not NETROM appliances). There is a lot of progress
already, though. Stay tuned and plugged in.

 Subject: KAM mod (easy)
 Some of you might have read the bulletin I wrote about improving

the carrier detect on the KAM. This mod greatly improves the
reception of packet as well as prevent you from transmitting on
top of an other signal.
The best way to do this mod is by just soldering a 22k or 27k
resistor across R47. R47 is a 220k resistor. It might be a bit
difficult with out the right tools to remove the old R47. So
leave it in and just solder the new one across it on the other
side of the board.
The mod changes the time constant of the rc network formed by
C29 and R47. Which is part of the carrier detect function on hf.
Now that it operates faster, it will do a better job. You should
see a lot more stations while monitoring and have less retries
while connected or trying to connect.
I would like some feedback from people who tried this.
73 de Nand ve3iwj @ ve3iwj.
note: I have not tried or verified this mod, proceed at your own risk.

Subject: Receiving packet w/o TNC

In article a recent article by IBTUSM02@CZHETH1I.BITNET (Tom Anna):
>
>
>Why not do it ALL in software ? Hardware requirements: 1 A/D converter
>8 bit / 8kHz, a little buffer RAM, and some TTL stuff, all together on
>a small PC plug in card. This card digitizes the audio signal from the
>receiver in a CD player style, and makes it accessible to the computer.

This can be done, but you can probably get an 8530 (or other SCC) and a
modem (e.g., 7910) for less than the price of the above hardware. In short,
yes you can do it, but why?

>Software: Some digital filtering, a demodulator and a packet disassembler.
>If you sample the audio signal with 8K samples/sec, there is 125 mikro-
>seconds CPU time per sample: This should be enough for these tasks.

In my not-too-long-ago days, I'd say "gofer it!", but today I'd say "you're
reinventing the wheel." If you want to do it for a learning experience, then
by all means, have at it! If you are looking for an inexpensive (and quick)
way to get on packet, this probably isn't the way to go about it.

>Only by software changes you could also receive RTTY/AMTOR/SSTV/weather ...
>With little extra hardware you might also transmit all these modes.

Now there you go! If you really want to support a multitude of protocols/
standards, design a board using a DSP chip (TI 32010, Motorola 56K, etc.),
an ADC/DAC, and the required glue and you're REALLY cooking! :) Let the
host processor format the data and let the DSP chip do all the filtering and
signal generation/detection/decoding. The AMSAT/TAPR folks are working on

a project similar to this, and I believe it really holds a lot of promise.

>I don't know who started the 'wb6cyt.ampr' custom; it's not very useful
>and it's not very correct. I think we should stomp on it.

I think this is a holdover from when we hoped that .ampr would become a top level domain... now that it's officially .ampr.org, I've been pushing people to put either simple hostnames without the .ampr.org, or fully qualified domain names only, and not anything in between... you suggestion of punting the .ampr.org on traffic over the air for the moment seems like a good one.

QSL INFORMATION.

HV3SJ, PINO, WILL QSL VIA HIS HOME ADDRESS. I0DUD IS HIS HOME CALL.
T5GG QSLS GO VIA I2MQB.
JY9IU, WALTER, CARDS VIA HB9AHA OR DIRECT TO WALTER HEDIGER, BOX 13143, AMMAN, JORDAN.
6W7OG ASKS FOR QSLS VIA HIS MANAGER, F2YT.

DL1OAX/UG6 SAYS CARDS TO HIS HOME CALL, INER MUNDT, BAECKERSKAEMPEN 17, 3070 NIENBURG, FED GERMANY.
HH2PJ CARDS GO VIA BOX 13146, DELMAS, PORT AU PRINCE, HAITI.
YJ8JS SAYS TO QSL TO G0CGL.
A CORRECTION TO LAST WEEK. THE QSLS FOR THE U.S. STATIONS WHO WORKED THE 3W1 OPERATION GO TO W4FRU NOT WA4FRU. REPEAT, THEY GO TO W4FRU.
ALSO THE CARDS AND CONTRIBUTIONS FOR THE VU7JX OPERATION THIS WEEKEND GO TO W2XP.

NOTES OF INTEREST.

THIS WEEKEND VU7JX WILL OPERATE DURING THE BARTG CONTEST FROM THE LACCADIVE ISLANDS. QSL VIA W2XP.

THERE IS A REPORT THAT OCEAN ISLAND WILL BE SEPERATED FROM KIRIBATI, AND COUNTED AS A NEW COUNTRY.

DJ6JC WILL OPERATE FROM TY6JC, BENIN, STARTING MARCH 25TH FOR ABOUT 7 DAYS.

APRIL.

5W1GP WILL BE QRV FROM ROTUMA FROM 6TH APRIL. HIS LENGTH OF STAY IS NOT KNOWN, BUT HE WILL BE OPERATING BATTERY EQUIPMENT.

XF4L REVILLA GIGEDO WILL OPERATE FROM 11 TH TO 19TH. THEY HOPE FOR RTTY OPERATION AS WELL AS OTHER MODES. QSL TO OH2BN.

MARION ISLAND, ZS8 WILL BE ACTIVATED DURING APRIL. EQUIPMENT HAS BEEN DONATED BY W6PQS AND THE SOUTHERN CALIFORNIA RTTY GROUP.

MAY.

ST PETER AND ST PAULS ROCKS WILL BE ACTIVATED 3RD TO 10TH JUNE. THE RTTY CALL WILL BE ZY0SY. OPERATION BY THE NATAL DX GROUP, BRAZIL.

JUNE.

TK/HB9CJC WILL OPERATE FROM CORSICA FROM JUNE 4TH TO JULY 2ND. QSL TO HIS HOME CALL.

JG1RVN WILL OPERATE FROM KC6, BELAU, DURING JUNE. QSL TO HIS HOME CALL.

AUGUST.

ANGOLA HAS BEEN DELAYED UNTIL AUGUST DUE TO CHANGE OF MILITARY PERSONNEL. QSL VIA I5ICY.

NOW FOR THE RUMOURS. IT HAS BEEN UNOFFICIALLY REPORTED THAT TUBUAI ISLAND, CHESTERFIELD ISLAND AND FREDERICK REEF WILL SHORTLY BE LISTED AS NEW COUNTRIES. (??)

GL DE DX1.

From: rochester!rit!cci632!cb@cu-arpa.cs.cornell.edu (Curtis Braun)
Subject: Where Can I get started... Beyond tnc-2

I've been reading about alternatives, etc to tnc's and ax.25 packet.
This is most provocative. I am not familiar with the radio part
of communications other than a frustrated usr of packet radio via
a hd4040 tnc @1200baud. I KNOW that there is a better way...

It seems to me that if a telebit modem can fly at some higher speeds,
and that the telephone industries can do ISDN (they too need a better
spec) than where can we go. Can't we do multidrop 9600+ communications
like the telephony industry. Why can't a bbs feed be multidrop, then
I won't have to "dial" ops "connect" to one, I'd have my mail on my
BOX where it belongs. With the compression techniques like PKZIP's
archiving program, why can't we incorporate it the scehme of things?
I just heard of a program called flashlink which provides mnp 4 and
mnp 5 additions to the standard modem interface (via software) to
speed up the through put? Why can't the actual packet size be variable
for higher through put? Why can't we do full duplex communications
on the radio, repeaters do it?

As you can see I have a lot of questions, it seems that some of the
local people that I have spoken to have no interest in advancing
the sport. I have found a few that are willing to do Usenet mail
via radio (probably using tcp/ip), but I have a lot ot learn.

Thanks,

    Curtis (!rochester!kodak!n2hkd!curtis or cb@cci632.uucp) N2HKD

From: dcatla!dndmp@gatech.edu (David M. Panetta)
Subject: XEROX 820 as a TNC?

I am looking for any information which will help me convert my old
XEROX 820 cpm system for use as a TNC. I would be interested in any
hardware mods and software/firmware information. I have hardware and
software background on the 820 board, but little knowledge about the
how and what to make a TNC. I have an 820-I board with all schematics
and manuals.

Please e-mail responses to the address below. Thanks in advance and 73.

PACKET-RADIO Digest   Fri, 24 Mar 89   Volume 89 : Issue 78

Today's Topics:
                    Need packet bbs for SysV Unix

Date: 22 Mar 89 15:01:04 GMT
From: mcvax!kth!draken!tut!tolsun!so-luru@uunet.uu.net (Ari Husa)
Subject: Need packet bbs for SysV Unix

Does anybody know of a packet bulletin board system for
Unix SysV (CTIX) -based computers? The system would preferably
follow the standard RLI/MBL -procedure for forwarding
messages.

We would like to get the source code for such a beast,
and port the system on our Convergent Miniframe computer.
A complete, ready-to-run system would also be acceptable,
if there is such thing around...

Also, please, can somebody tell me the e-mail-address for
Hank, W0RLI? We would love to discuss the possibility to
get the latest source code of his bbs software. We are currently
running a WA7MBL 5.12 bbs on a pc/xt, and we are QUITE satisfied.
Anyway, a true multi connect, multi process system would be
of GREAT interest...

Thank You in advance and vy 73,

I'm looking into buying a tnc. I was wondering if I could get some
feed back from some people that may have these models:

Pac-Comm: Looks good... seems to support alot of stuff (netrom
kiss, UHF/VHF & HF). Also farly cheap ($119 for the
Tiny-2 & $159 for the mp-2). But is it any good?

Pakratt-232: Seems to do it all. Also seems like alot of people
are using them. But at ~$320 is it worth it?

heath pocket packet:
Looks real neat, but it doesn't do netrom or HF. ($219)
(73 has a good review of this in their march edition)

KAM: Haven't found much info, but they say they're the best.
Does anyone have anything to say about um?

I would like to get something good for portable use... Yet I would still
like it to be some what flexable. The heath is too much of a trade off.
The pac-comm mp-2 may be the one, but I don't know if it's any good. Does
anyone have any thoughts?

I am thinking of getting back into Packet Radio using TCP/IP. As I
see it 1200 baud is painful at best and if it isn't already will be
obsolete soon. I have been following things a bit and it seems like
there are several modems becoming reasonably available. I believe
there is onw that claims to get 4800 baud on most radios with minimal

tweaking. And I have seen 9600 baud advertised and discussed as well.
I feel the really high speed stuff won't be used for genreal
communication but for backbones and bridges.

What modems are available now and that will become the "next thing"?

Also, can anyone point me to some local (MA/NH) groups that are doing
TCP/IP.

Thanks.... jv

John, you're correct WRT running TCP/IP over 1200 bps packet links; it's
painful at best. Going to the 4800 bps modems from HAPN (or other) will
make your throughput a little better, but don't expect a 4X performance
increase. Going to 9600 bps will see somewhate better performance. All of
this falls apart if your transmitter or receiver (or the other guy's set)
is slow to key up or turnaround.

Of course, the Heatherington modems (56kbps) are available, and others are
doing work on higher speed modems. Bdale Garbee is working with another
individual on "10 GHz Ethernet." If you're interested, I'm sure you can
hack around with other high-speed possibilities.

Your assumption that high speed stuff won't be used for general communications
may be true for the regular rtty-packet folks, but I'd love to have a local
comm channel running at 1 Mbps or greater with several hosts on it. A lot
of us would like to link our PC's and UNIX boxes together so we can do
some "real work" (so to speak); the slower speeds make it difficult, if not

impossible.

By all means, John, don't let 1200 bps modems scare you away from amateur
TCP/IP! It's an exciting part of packet that is seeing very impressive growth.

Mike

Hi,

I am running a Commodore Amiga A500 withe the 870829.24 release of the
KA9Q TCP/IP Internet package, and I am now feeling left behind as quite
a few of my friends are using much later and more sophisticated versions
(871225.33m etc!). What I was wondering is, Does anyone know of a later
version for the Amiga.

>What modems are available now and that will become the "next thing"?

Since springtime of '87 there are the NORD><LINK modems available
(developed by myself).
These modems utilize a DPSK modulating scheme which is modeled after
the CCITT V.26. At a subcarrier of 1800 Hz and at a baudrate of 2400 Bd
there's a datarate of 4800 bps available (dibit-encoding scheme)
or 4800 Bd / 9600 bps.

 Some highlights of this modems are:
no DC component in signal at any time, so lowest AF of xferchannel
is > 400 Hz.
fast synchronisation time of modem : < 5 msec (@ 4800 bps)
     (faster at higher speeds)
no squelch required, therefor no squelch delay (usually 50...150 msec)
interface conforms to CCITT X.21bis (similar to RS232), TTL level
     signals available by means of some jumpers.
modem supplies rx and tx clock.
only standard CMOS-ICs required,
only 1 PS (+10...+14V) necessary (< 3 W).

Several of these modems are running here since some time with no general
problems so far. The modems are tested on TNC1s and different TNC2 clones.

Like all modems for higher speed these DPSK modems have to be pluged
to a separate data input / output connector at the TRXs.
Future intentions are to provide a dualmode uplink at the nodes so
users might use 202 1200 bps or DPSK 4800 bps on the same frequency.
But this isn't finished yet.

Hello, Jim!

About the CTIX BBS program...

Thank you for your answer! I did receive your mail, but somehow I don't seem
to get my reply through... it just keep on bouncing back time after time.
the MAILER-DAEMON@vax.cs.pittsburgh.edu claims your host to be unknown. Any
ideas how to get through, anyone? It would be greatly appreciated!

My apologies to everyone for this posting. I did try, HONESTLY.. ;-)

ARRL BULLETIN 14 ARLB014
FROM ARRL HEADQUARTERS
NEWINGTON CT MARCH 27 1989
TO ALL RADIO AMATEURS

AN AMATEUR RADIO STATION IS SCHEDULED TO FLY ABOARD THE SPACE SHUTTLE
IN MARCH 1990. APPROVAL FOR THE INCLUSION OF THE SPACE SHUTTLE
AMATEUR RADIO EXPERIMENT CALLED SAREX ON THE SECONDARY PAYLOAD LIST
OF FLIGHT STS 35 HAS BEEN RECEIVED FROM NATIONAL AERONAUTICS AND
SPACE ADMINISTRATION HEADQUARTERS. RON PARISE, WA4SIR, A PAYLOAD
SPECIALIST FOR THE ASTRO 1 PAYLOAD TO BE CARRIED ON THAT FLIGHT WILL
OPERATE THE STATION IN THE ORBITING SHUTTLE. REPRESENTATIVES OF ARRL
AND SAREX, COSPONSORS, THE RADIO AMATEUR SATELLITE CORPORATION,
AMSAT, STATED THAT THEY LEARNED OF THE APPROVAL AT A MEETING WITH
NASA OFFICIALS HELD ON MARCH 14 AT THE LYNDON B JOHNSON SPACE
CENTER IN HOUSTON.

WA4SIR WILL COMMUNICATE WITH AMATEUR OPERATORS WORLDWIDE USING VOICE
AND VIDEO COMMUNICATIONS AS WELL AS PACKET RADIO. THE ORBIT OF THE
SHUTTLE WILL ALLOW AMATEURS LOCATED BETWEEN APPROXIMATELY 46 DEGREES

NORTH AND 46 DEGREES SOUTH LATITUDES TO COMMUNICATE DIRECTLY WITH THE
SHUTTLE. THE SAREX TRANSMISSIONS FROM THE SPACE SHUTTLE WILL BE SUCH
THAT A STANDARD SCANNER RADIO CAN RECEIVE THEM.

THE APPROVAL FOR SAREX OPERATION IS CONTINGENT ON FINAL APPROVAL BY
JOHNSON SPACE CENTER OF THE SAREX HARDWARE AND OPERATIONS PLAN AND ON
PRIORITIZATION OF SECONDARY PAYLOADS FOR THE STS 35 FLIGHT.

Subject: Trends in Packet

I am thinking of getting back into Packet Radio using TCP/IP. As I
see it 1200 baud is painful at best and if it isn't already will be
obsolete soon. I have been following things a bit and it seems like
there are several modems becoming reasonably available. I believe
there is onw that claims to get 4800 baud on most radios with minimal

tweaking. And I have seen 9600 baud advertised and discussed as well.
I feel the really high speed stuff won't be used for genreal
communication but for backbones and bridges.

What modems are available now and that will become the "next thing"?

Also, can anyone point me to some local (MA/NH) groups that are doing
TCP/IP.

Thanks.... jv

We have just begun testing the HAPN 4800bps modems in the San Antonio
area. These are on 70cm for user access (primarily TCP/IP, at least
initially). They have not been installed long enough to give an exhaustive
review, but so far we are fairly pleased with them.

The thing that attracted us most about the HAPN boards was the cost: $45
for a kit that installs inside your TNC2. Construction was fairly easy,
and installation in the TNC straightforward.

On the down side, you must modify your radio "take-off" points. The
receive audio must come directly out of the discriminator, and the transmit
must go straight to the modulator (will work with either FM or PM). On the
other hand, I am now using the same points for 1200bps as well, and with a
minor mod to the TNC, it works even better than going through the mike
connector. Also, you can install a simple SPST switch to change from 1200
to 4800 instantly.

I would enjoy hearing from folks who have tried some of the 9600bps modems.
I will post more information on the performance of the HAPN boards after
they have been in use for a while.

Subject: TCPIP for Amiga

Hi,

I am running a Commodore Amiga A500 withe the 870829.24 release of the
KA9Q TCP/IP Internet package, and I am now feeling left behind as quite
a few of my friends are using much later and more sophisticated versions
(871225.33m etc!). What I was wondering is, Does anyone know of a later
version for the Amiga.

From: cs.utexas.edu!sm.unisys.com!ism780c!kirkd@tut.cis.ohio-state.edu (Kirk
 Davis)
Subject: tnc's

I'm looking into buying a tnc. I was wondering if I could get some
feed back from some people that may have these models:

Pac-Comm: Looks good... seems to support alot of stuff (netrom
kiss, UHF/VHF & HF). Also farly cheap ($119 for the
Tiny-2 & $159 for the mp-2). But is it any good?

Pakratt-232: Seems to do it all. Also seems like alot of people
are using them. But at ~$320 is it worth it?

heath pocket packet:
Looks real neat, but it doesn't do netrom or HF. ($219)
(73 has a good review of this in their march edition)

KAM: Haven't found much info, but they say they're the best.
Does anyone have anything to say about um?

I would like to get something good for portable use... Yet I would still
like it to be some what flexable. The heath is too much of a trade off.
The pac-comm mp-2 may be the one, but I don't know if it's any good. Does
anyone have any thoughts?

From: tektronix!orca!tekecs!mhorne%ka7axd.WV.TEK.COM@uunet.uu.net (Mike Horne)
Subject: Trends in Packet

John, you're correct WRT running TCP/IP over 1200 bps packet links; it's
painful at best. Going to the 4800 bps modems from HAPN (or other) will
make your throughput a little better, but don't expect a 4X performance
increase. Going to 9600 bps will see somewhate better performance. All of
this falls apart if your transmitter or receiver (or the other guy's set)
is slow to key up or turnaround.

Of course, the Heatherington modems (56kbps) are available, and others are
doing work on higher speed modems. Bdale Garbee is working with another
individual on "10 GHz Ethernet." If you're interested, I'm sure you can
hack around with other high-speed possibilities.

Your assumption that high speed stuff won't be used for general communications
may be true for the regular rtty-packet folks, but I'd love to have a local
comm channel running at 1 Mbps or greater with several hosts on it. A lot
of us would like to link our PC's and UNIX boxes together so we can do
some "real work" (so to speak); the slower speeds make it difficult, if not
impossible.

By all means, John, don't let 1200 bps modems scare you away from amateur
TCP/IP! It's an exciting part of packet that is seeing very impressive growth.

Mike

>What modems are available now and that will become the "next thing"?

Since springtime of '87 there are the NORD><LINK modems available
(developed by myself).
These modems utilize a DPSK modulating scheme which is modeled after
the CCITT V.26. At a subcarrier of 1800 Hz and at a baudrate of 2400 Bd
there's a datarate of 4800 bps available (dibit-encoding scheme)
or 4800 Bd / 9600 bps.

Some highlights of this modems are:
no DC component in signal at any time, so lowest AF of xferchannel
is > 400 Hz.
fast synchronisation time of modem : < 5 msec (@ 4800 bps)
(faster at higher speeds)
no squelch required, therefor no squelch delay (usually 50...150 msec)
interface conforms to CCITT X.21bis (similar to RS232), TTL level
signals available by means of some jumpers.
modem supplies rx and tx clock.
only standard CMOS-ICs required,
only 1 PS (+10...+14V) necessary (< 3 W).

Several of these modems are running here since some time with no general
problems so far. The modems are tested on TNC1s and different TNC2 clones.

Like all modems for higher speed these DPSK modems have to be pluged
to a separate data input / output connector at the TRXs.
Future intentions are to provide a dualmode uplink at the nodes so
users might use 202 1200 bps or DPSK 4800 bps on the same frequency.

But this isn't finished yet.

RTTY DX NOTES FOR WEEK ENDING 24TH MARCH 1989
(BID RTDX2403)

FIRST, WE HOPE THAT EVERYONE HAS A VERY HAPPY AND HOLY EASTER. WE HOPE
THE DX COMES TO YOUR SHACK IN GREAT ABUNDANCE. IN THE NOTES YOU WILL SEE
SOME STATIONS LISTED AS 28 MHZ, ETC. THESE WERE SOME OF THE STATIONS WHO
WERE WORKED/SEEN DURING THE CONTEST. UNFORTUNATELY WE COULD NOT LIST ALL
THE STATIONS THAT WERE IN THE CONTEST, AS SOME OF THE STATIONS WORKED OVER
700 CONTACTS. SO ONE MIGHT SAY THAT ALL BANDS WERE OPEN AT SOME TIME
DURING THE CONTEST PERIOD.

OUR THANKS THIS WEEK GO TO TG9VT, W1DA, KT7H, LA5WBA, OD5NG AND VK2EG.

BANDPASS:

FRIDAY.

QSL INFORMATION:

CORRECTION TO LAST WEEKS QSL INFORMATION, T5GG QSL MANAGER IS I2MOP.
VU7XP WILL QSL VIA W2XP.
3B8FP WILL RECEIVE HIS CARDS VIA KN2N.
DL1OAX/UG6 WILL QSL VIA HIS HOME ADDRESS. HE WILL BE THE OPERATOR IN ARMENIA FOR A FEW MORE WEEKS.
J73EH QSLS VIA WA4WIP.
TY9JC WILL QSL FROM HIS HOME ADDRESS OF DJ9JC.

NOTES OF INTEREST:

LA2FFA WILL BE ACTIVE FROM ABOUT 84 DEGREES NORTH FOR ABOUT SIX WEEKS USING THE CALLSIGN OF JX0A, FROM 22ND MARCH USING PACKET AND OTHER MODES. NO MENTION OF RTTY.

APRIL.

IT IS REPORTED THAT JIM SMITH WILL BE ACTIVE FROM OCEAN ISLAND, EITHER THE END OF APRIL OR EARLY MAY. IT IS HOPED THAT HE WILL THEN TRAVEL TO TUVALU (T2) IF REQUESTED.

5W1GP WILL BE QRV FROM ROTUMA FROM 6TH APRIL. HIS LENGTH OF STAY IS NOT KNOWN, BUT HE WILL BE OPERATING BATTERY EQUIPMENT.

XF4L REVILLA GIGEDO WILL OPERATE FROM 11TH TO 19TH. THEY HOPE FOR RTTY OPERATION AS WELL AS OTHER MODES. QSL TO OH2BN.

MARION ISLAND, ZS8 WILL BE ACTIVATED DURING APRIL. EQUIPMENT HAS BEEN DONATED BY W6PQS AND THE SOUTHERN CALIFORNIA RTTY GROUP.

MAY.

ST PETER AND ST PAULS ROCKS WILL BE ACTIVATED 3RD TO 10TH MAY . THE RTTY CALL WILL BE ZY0SY. OPERATION BY THE NATAL DX GROUP BRAZIL.

JUNE.

TK/HB9CJC WILL OPERATE FROM CORSICA FROM JUNE 4TH TO JULY 2ND. QSL TO HIS HOME CALL.

JG1RVN WILL OPERATE FROM KC6, BELAU, DURING JUNE. QSL TO HIS HOME CALL.

AUGUST.

ANGOLA HAS BEEN DELAYED UNTIL AUGUST DUE TO CHANGE OF MILITARY PERSONEL. QSL VIA I5ICY.

GL DE DX1.

Subject: paccom tiny2 mod

From: rfc@briar.philips.com (Robert Casey;6282;3.57;$0201)
Path: briar.philips.com!rfc

Further to N2EZG's bulletin on constructing an adapter for the modem socket to improve the performance of Tiny-2 (and Micropower-2) TNCs that have become "hard of hearing": Gwyn, W1BEL, of PacComm advises that those not wanting to roll their own can call and they'll send an adapter, free of charge. Not all of the TNCs exhibit the problem, and recent revs of the TNC boards already have the mod (which inverts the phase of a clock signal) in place, so don't bother unless you are actually noticing degradation of the modem performance.

From: m2c!ulowell!tegra!vail@husc6.harvard.edu (Johnathan Vail)
Subject: Trends in Packet

I am thinking of getting back into Packet Radio using TCP/IP. As I see it 1200 baud is painful at best and if it isn't already will be obsolete soon. I have been following things a bit and it seems like there are several modems becoming reasonably available. I believe there is onw that claims to get 4800 baud on most radios with minimal tweaking. And I have seen 9600 baud advertised and discussed as well. I feel the really high speed stuff won't be used for genreal communication but for backbones and bridges.

What modems are available now and that will become the "next thing"?

Also, can anyone point me to some local (MA/NH) groups that are doing TCP/IP.

Thanks.... jv

We have just begun testing the HAPN 4800bps modems in the San Antonio
area. These are on 70cm for user access (primarily TCP/IP, at least
initially). They have not been installed long enough to give an exhaustive
review, but so far we are fairly pleased with them.

The thing that attracted us most about the HAPN boards was the cost: $45
for a kit that installs inside your TNC2. Construction was fairly easy,
and installation in the TNC straightforward.

On the down side, you must modify your radio "take-off" points. The
receive audio must come directly out of the discriminator, and the transmit
must go straight to the modulator (will work with either FM or PM). On the
other hand, I am now using the same points for 1200bps as well, and with a
minor mod to the TNC, it works even better than going through the mike
connector. Also, you can install a simple SPST switch to change from 1200
to 4800 instantly.

I would enjoy hearing from folks who have tried some of the 9600bps modems.
I will post more information on the performance of the HAPN boards after
they have been in use for a while.

Subject: WA7MBL BBS and KPC-2

    Hello, I am having a real problem getting Ver 5.12 of MBL's
BBS to work on a KPC-2. The DCD lead on the EIA-232 seems to be the
problem, have to dummy up the lead to make the PC talk to it. I have
used the BBS on a PK-232 with no problems. What I am asking is for
someone to mail me the settings for the KPC-2 when used with MBL bbs. I
would also like to hear from anyone that is using this BBS software.

Thanks
Jim Cook N8JBO

Subject: PK-232 RTTY Non-Std Shifts help

I am looking for someone who is very familiar
with the PK-232 Multimode box. I have been
reading the technical reference manual with
the intentions of retuning the Narrow band
transmitters and receivers to run 850 Hz
TTY shifts. I am not going to cannibalize the
1000 HZ Wide shift circuits, because I still
hope to run VHF packet. Hoping that I am
not a pioneer in this endeavour, I am looking
for advice from anyone who has been down this
path already.

Date: 27 Mar 89 20:25:27 GMT
From: att!alberta!dvinci!hardie@ucbvax.Berkeley.EDU (Peter Hardie)
Subject: VE3IWJ KAM Mod.

I installed the VE3IWJ change to R47 in the KAM by just paralleling a 22K resistor across R47. My experience has been that it does not significantly improve performance under good conditions and if the band is fading a bit then it degrades performance. If, for example, a station sends you 4 packets

in one transmission and you receive the first one or two packets at which point the band fades out and carrier detect drops momentarily, then the KAM will transmit an acknowledgement while the transmitting end is still sending packets 3 and 4. I just removed the mod but perhaps a somewhat larger value than 22K might help out.
I am still having the problem I posted before which is that on a busy channel the KAM takes an inordinate amount of time to retry an unacknowledged packet. If for example I send a packet and the other end does not reply, then if the channel is busy it can take as much as 30 seconds before the KAM tries to send the packet again and if the other end never sees the retries then with my RETRY=7 and FRACK=2 (AND PERSIST=255!!) it can take the KAM 5 minutes before it gives up. By that time though the other end may have already timed out and called the next BBS (some of them only wait 2 minutes or so). I have had replies to my previous query from 3 people (sorry I don't have names/calls here right now) one of whom thought I had set PERSIST very low (hardly likely OM!) and two from Europe who both have the same problem. I've also had reports from two US sysops that they've given up on their KAM altogether and got a PK232 so their BBS can do something useful.
Now, I know there are others out there using a KAM (perhaps?) and if you are not having this problem I'd like to know what your KAM parameters are set at. I find it hard to believe that more or less default parameters make the box totally useless on a busy channel (BTW one of the European ops said the same problem exists with the KAM on VHF too!)
ANY ideas???
Tnx + 73

>Define "packet terminal"... "packet BBS"... please?

 Packet terminal being one that will take the signals from the radio and
turn them into the ascii characters coming from the Packet BBS you're calling.
 Packet BBS being a bulletin board set up to be reachable through a tnc
connection.

XEROX-820 board for sale

A XEROX-820 single board computer is for sale. It has the following features on-board:

-- Z80 processor with 64 Kb memory

-- 4K monitor providing functions for

  ** Memory manipulation
  ** I/O port access
  ** Keyboard input and CRT display
  ** Floppy disk i/o

-- Floppy disk controller that can drive upto two 8" or 5-1\4" drives

-- CRT display controller (80 X 24 characters)

-- Parallel keyboard input interface

-- Two RS232 serial ports

-- Real-time clock

-- Z80 parallel i/o chip with two independent 8-bit parallel i/o
   ports. Can be configured for a variety of devices like printers,
   ROM programmers, analog devices, etc.

I can arrange to get CP/M on an 8" diskette if any one wants. The price is
US$90.00. Those interested may contact me at:

I had an interesting idea the other day.

I've been thinking for a few months about good ways to design a
portable "dynabook" style computer (see Alan Kay's stuff from Xerox
PARC years ago). Basically something the size of a book that's as
useful as a book (or a library) or notebook, and not nearly as much
pain as MSDOS or vi. But unlike a book it's dynamic -- sort of like
rec.ham-radio versus the ham magazines. N-way interaction, editing,
searching, and all that.

One problem is that due to power constraints there is not much info you can keep in a portable box the size of a book. For example, hard disks take too much power and space, even if they could stand being dropped in a mudpuddle a few times a year.

One way to alleviate this problem is by providing good portable communications. Keep most of the information in a base machine (and/or in a citywide library) and just stash the stuff you are currently working on inside the portable. Unfortunately, there is this problem.

We could only let you move stuff in or out of the portable when you were cabled up to your base station, but that severely limits how useful this thing is (can't make appointments, or receive and respond to messages during the working day, or call up references while in a meeting, or look up something in a "book" that you didn't load into the portable this morning).

We could build in a cellular phone but that adds $2000 (if handheld) and the per-minute charges would eat you alive. And the bandwidth is bad since it's designed for voice.

We could use infrared links but they are low speed and low reliability and carrying your 'book' outside on the lawn wouldn't work on sunny days, nor would it work when you weren't in line-of-sight.

We could use ham packet radio links but the *&^$%#@ hams are too stuck on keeping the spectrum free for yammering at each other. How many people would learn morse code and radio regs so they could buy a 'dynabook'? Damn few, and with good reason. Also, you couldn't do business over it. And the bandwidth is bad because it takes Special Government Permission to run at a reasonable speed.

We could use commercial radio frequencies but then you'd have to pay somebody rental to use it, even when just talking between your 'book and your home computer. Plus a major hassle for the manufacturer in getting the FCC to give out some frequencies everyplace somebody wanted to use a 'book.

Now if the PDRS proposal had a chance in hell of passing, I might even feel comfortable about building and selling a dynabook using PDRS as a communications method. When in your own home, it would automatically use very low power to talk to your base system (that IBM PC you'd never use again once you had the 'book). When out in the world, you'd still be connected, via other peoples' base stations and public repeaters.

BUT NOOOOOO!!!

This is not an attempt to start another morse code flame war. I probably won't even get around to reading the ham groups for another six months. I am just hoping to slide the idea into a few of your ossified heads

that you are giving up possibilities that you are incapable of imagining
by shooting down every proposal to give the public some free access digital
spectrum space.

You can *already* get such a two-way digital communications device.
The IBM CE's around here use them for communications with their office.
They also have a built in 300 bps acoustic modem for a fallback.

John Gilmore talks about book-sized 'interactive' books
See his article for details....

Here's a thought. How about making the I-book with an editor, and the editor would save all changes made in the book. When you plugged into the base, the I-book would make all changes. If you used something like an EPROM this would be easy, except you would have to leave it plugged in for a while to make the changes. The I-book, then, would just have to save the editing changes you made to it, and perhaps with the right set-up, it could interpret these change and display them on the screen, thereby making the 'editor memory' transparent. It might work, as long as you didn't do a lot of editing.

Just some random thoughts from an not quite stable person.

The amateur radio community is not opposed to the use of Packet Radio
technology in other services. They have been very involved in putting
it into service for Public Service organizations such as FIRE, POLICE,
Civil Defense, 3rd World Telecommunications Projects, etc. MOSTLY on
volunteered time.

The hams are also not opposed to a Public Digital Radio Service (PDRS),
in principle. The opposed the STONER PDRS at 50 MHZ. for some very
definate reasons:

1. The proximity to channel 2 on your TV.
2. It was to reallocate a portion of Amateur Radio
   Spectrum WHICH IS IN USE to a commercial enterprize.
   There are frequencies in the commercial spectrum
   which could and are used for Digital Communications.
3. Amateurs are doing a lot of research in this area
   and have recently worked with the FCC to make the
   entry into the Digital Side of the hobby much easier.
   [It would be very difficult not to get a license if
      a person just studied for a couple of weeks]. However
   Amateur Radio is a PUBLIC SERVICE, FRATERNAL, AND
   EXPERIMENTATION SERVICE not to be used for BUSINESS.

We welcome anyone who is interested enough to work a little for the license
and will help those who would like to apply this technology in another
service.

Whaddya think packet radio is using??? On HF, bandwidth restrictions limit
the rate to about 300 Baud.
>
> We could use ham packet radio links but the *&^$%#@ hams are too stuck on
> keeping the spectrum free for yammering at each other.
Why not take away some cellular phone spectrum. It's only used by people
who yammer at each other.
Better yet, there's roughly 1 Mhz of spectrum at about 27Mhz that is only
used by people who yammer at each other and a fair chunk of that is ILLEGAL
so why not clean it up and make better use of it?

> We could use commercial radio frequencies but then you'd have to pay
> somebody rental to use it, even when just talking between your 'book

> and your home computer.
The REAL point to the whole thing. What John wants is FREE access to a chunk of spectrum. The problem is he hasn't really figured out how much spectrum is really required for what he is proposing. In metropolitan areas the ham VHF/UHF bands are very crowded even though hams constitute considerably less than one percent of the U.S. population. If this book idea were to get off the ground then John wants to use wide bandwidth so that he can use a high data rate and also presumably wants to make the book accessible to everyone. Even though packet radio is an efficient use of spectrum it is still going to be very difficult to cram the number of users into any reasonable chunk of spectrum. Certainly there is no room for it in the VHF bands, whether or not you take the ham spectrum away. The only way I can see it fitting at all is to get way up into the Ghz range so that not only can wide bandwidths be accomodated with lots of channels but also the antenna that is required is very small.

Our heads ain't ossified. It's your ossified head that hasn't thought this through properly.
(I'd wholeheartedly support giving the public free access to the CB band for digital communications!)

Can anyone e-mail to me or post to the net information on doing
your own brassplating/electroplating at home. I am looking for
either specific directions or a source with detailed info.
Particular info is needed for the solutions to be used for plating.
I have access to most common chemicals and solutions or could make them.
The objects I wish to plate are small: doorknobs, hinges, fixtures, etc.
Thanks !!!

Can someone provide (mail, please) any of the following for the Sharp
PC-5000:
     Schematics

Memory map
Port addresses
Programming info for serial port, keyboard, display, etc.
Bubble format info (where is MS-DOS really?)
Pinout for external bus.
Protocol for external bus (especially for floppy).
Any non-standard BIOS ints?
Anything else interesting that you happen to know?

Anybody in eastern Mass/southern NH who has one with the floppys who could let me transfer a few things to bubble?

Suggestions for dealing with the fact that the serial port is named AUX and that BASIC only has modem control/speed setting hooks for devices named COMn? I could do a simple XMODEM hack in BASIC to get started if I get around this one.

Thanks for reading this far.

I wouldn't bet my account on it. First of all, it's not MIT "getting

away with this". The only reason that that message has an eddie.mit.edu
ID is that the ARPANET mailing list it came from is gatewayed to the
USENET at mit-eddie. The poster, and his real address, is in the
attribution line.

I'm not claiming that it's any better to float copyrighted source around
the ARPANET than around the USENET; I just want mit-eddie kept out of
it...

I wish you hadn't brought this up. Linear Feedback Shift Registers
(LFSRs) are already in use in the K9NG and WA4DSY amateur packet radio
modems as data randomizers. They're called "scramblers" in the
commercial world, but this word has bad connotations in the amateur
world. The purpose of a scrambler or randomizer is NOT to hide the data
being sent, but rather to change its statistics to improve the modem's
performance and to reduce co-channel interference. In particular,
scrambling gets rid of the DC component in a long flag stream, and it
guarantees plenty of data transitions for clock recovery in the event
you're not running HDLC and you're sending long strings of 1's or 0's.
In part 97 wording, the purpose here is to facilitate communications,
not hide the meaning.

You need to know the polynomial (the taps on the shift register) being used in order to decode a randomized data stream. Steve and Dale have published their polynomials, so as far as I'm concerned they aren't encrypting. However, this wouldn't be much of an encryption system even if they tried to keep their polynomial secret. All you need is 2N bits of the pseudo-random sequence generated by the LFSR (where N is the number of stages in the shift register) and you can obtain the polynomial by solving a simple linear system of equations.

Shift register feedback systems intended for encryption must use NON-linear feedback. The effect of this is to simulate a LFSR with an extremely long register, so long that the attack just mentioned isn't practical.

Based on the available public information about the secret NSA algorithms now being recommended for the replacement of DES I think it's a good bet that they're based on nonlinear feedback shift registers. I say this because they're stream ciphers and they run much faster than DES in hardware. NSA also claims that you have to get your keys from them in order to guarantee security (!) because constructing a "good" key requires special knowledge of the algorithm. All this is consistent with the nature of non-linear feedback shift register algorithms.

Phil

It would seem to me that a public key crypto-system would be perfect

for this kind of application. You could query the machine for its
public key, encrypt your password using that key and then transmit
your encrypted password. The machine which you are trying to access
then decodes your password with it's private key and verifies login.

The primary problem with using a public key system is selecting which
method to use. The best method is RSA, but RSA is patented and cost
mega bucks. Knapsack could be used, but it has been broken. This
might not be too much of a problem though since super secure
communications is not needed, it would be on packet radio if security
was important.

Cheers,

Two problems with this:

1) You're still encrypting things. It's illegal to send encrypted messages
    (of any kind) over the Amateur Radio Service.

2) If the machine only has it's private key and a single public key, what's
    to stop the Bad Guy from listening to what my password looks like when
    transmitted back to the system, and just using that?

I am looking for information on ways to adapt my very
compatible PC clone to a 12 volt power source. I am a member
of my local Emergency Management Amateur Radio group and we
are looking at ways to run these toys in vehicles in
conjunction with packet radio.

The first issue is the basic power supply: what's on each pin?

Is any of it AC ?

If we can get away without having to supply a low level (or
any level AC) source then we can probably cook up something
for any DC voltage required.

We don't want to use one of those power inverters...they're
hogs on juice !

Anybody done this before ?

Any thoughts ?

Thanks, Gordon Beattie houxm!hou2d!n2dsy

This is easily corrected with a "nonce identifier". You are missing the
more fundamental problem of an active eavesdropper who simple substitutes
his/her favorite public key.

Jim

A week or so ago I put a message on the net looking for source
code for a small PC or Unix OSI protocol stack.  I am happy to
say that several folks responded to me.  I'm sorry to report
that they chose to do it privately...
WHAT'S WITH YOU GUYS ?

Don't get me wrong I am thankful for the responses...and I
would love to hear from folks who may have stuff to offer
 - even a single protocol layer contribution is of interest...

What I guess I'm frustrated about is that I chose a title of
OSI Protocol Software which spurred several people into
action, but

MOST of the "respondents" who used the title were:

1. Interested in pushing Internet,
2. CCITT/ISO/COS/OSI bashing, and
3. NOT CONTRIBUTING to the request.

To them I should probably not say much more on the subject
(other than what is above), because I try to remain a
gentleman even when I disagree...
```

NOW...
What was in the original request ?

In summary:
I am interested in seeing OSI protocols in general use.
A subset of these protocols is being assembled for the PC
clones...but we want to have a good selection of
implementations at each layer...so if you have something or
know of implementations LET ME KNOW !

WHY ?

We are going to circulate a public domain (no profit a la
Columbia University's Kermit) OSI stack for the PC. We'll
give it plenty of use where ever we can...specfically in
Amateur Radio Packet Networks and in the Freeware/Shareware
landline Internet and BBS worlds.

We feel that this approach will help popularize and refine OSI
protocols.

Thanks,

   J. Gordon Beattie, Jr.

Does anyone know of bullitin board software for the Apple II computers?
I would prefer to find public domain software, but would like to hear
of anything that is available. I would like to get a BBS system going
on my ham radio.

If I get a good response I will be glad to summarize for the net.

Thanks in advance for the help!

The following quotes are courtesy John Gilmore (gnu@hoptoad.uucp)
from an article in comp.dcom.modems:

>As a 15-year computerist who got a ham license to experiment with
>packet radio, let me comment. The ham fraternity is seriously
>reactionary. Hams work hard to keep others out, so there will be more
>frequency spectrum for them to use, and they actively spy upon and
>report (to the Feds) violations of the mickey-mouse rules they operate
>under. Everything you do is under control of government regulations
>which take years to update, and the army of reactionary spies makes it
>hard to operate outside the rules.

The ham fraternity is anything BUT reactionary. Nuclear war wouldn't
wake half of them up!
Perhaps hams in the US have the attitude that "it's mine, go play
in your own sandbox." This does not seem to prevail outside of the
US. Perhaps that's why the FCC has the wisdom to start the US phone
bands above the international allocations...
Perhaps you consider federal legislation "mickey mouse." The rest
of the world (for the most part) does not (thank God). Of course
in California murder is also a "mickey mouse" law ("don't change lanes
so close to me a**hole or I'll blow your brains out!").
I hate to make you face reality John, but most things in life are
under control of gov't regulations. It's a good thing there are
"reactionary spies" to keep people operating within the rules. If the
FCC is faced with having to enforce the regs in the ham bands, there
won't be hams bands in very short order (in the US anyway... hey, that's
not a bad idea).

>In contrast, the computer fraternity is seriously radical. New ideas
>and new people are welcomed. Experimentation is encouraged. If you
>get a good idea and you do it, people are free to do things the old way
>or do it your new way. You don't need to ask the FCC whether you can
>plug a better printer or piece of software into your computer, or whether
>you are permitted double the speed of your machine. If you can afford
>to buy it or have enough imagination to create it, you can use it.

The only time you need to ask the FCC about hooking up a piece of
equipment is when the act of "hooking it up" might effect another
persons ability to use whatever it is you are hooking up to. If you
wire your printer cable wrong, you will zap your own computer - not
someone elses. If you wire your phone wrong you could impact all
the users on your exchange. If you transmit spurs and/or harmonics
you are going to bother a lot of non-hams. The regulations are in
place to ensure that these other users have some recourse in the
event you interfere with them.

>I was interested in packet radio as a vehicle for carrying data for
>computer users. While at least 4 or 5 people in the Pacific Packet Radio
>Society (the local ham digital-radio group) agreed, the rest of the
>hams were solidly against the idea of computer users being able to just
>send their data through the ether without going through all the hassle that
>THEY had had to go through. They wanted to use their new, experimental

>packet radios for the same old shit -- ragchewing (ham-ese for shooting
>the bull over the radio).

Sounds like you want to become a common carrier. If you think getting
a ham license is so damn difficult, then you should get a license to
become a common carrier. I would be interested in talking to you
about the application process when you're done (you should be finished
in about 1990). The cost of the application should not be a problem.
As you indicated above, the nice thing about the computing hobby is
that you can buy anything if you have the money. C'mon John, let's
see you finance a country wide packet network.

>What hams knew, or wanted to know, about computer networking in 1982
>would fill a thimble, maybe. There are a few people like Phil Karn who
>span both computer networking and ham radio, but the rest were
>basically ignorant. Their "networking" consisted of passing 10-word
>messages from one person to another, by voice or Morse code, down a
>line of humans, on a fixed nightly schedule. This was (is) mostly done
>by people who have nothing better to do than read other
>peoples' messages over the air. This has nothing to do with
>computer networking, though these people have finally realized that
>they can automate the processing if they can ever get their packet
>radios to work reliably enough. So now they want a few computer people

>spectrum.
>
>[They claim to be practicing for providing emergency communications
>service. However, if the public was permitted to use the airwaves for
>REGULAR communications service, then no EMERGENCY service would be
>needed, since the regular service would continue to work in
>emergencies. E.g. the cops don't rely on hams, they have their own
>radios for regular and emergency use.]

As you may be aware, those of us in Edmonton had the misfortune of
experiencing a rather nasty tornado a couple of weeks back. It hit
at roughly 1507, and had passed over the city by 1530. At that time
I was doing work for one of our clients (Alberta Public Safety Services -
the Provincial gov't organization that handles peacetime disasters).
By 1600 I had activated the amateur station at APSS (VE6ACD) and was
putting together a list of hams and equipment available to help
with communications. At 1700 we received a request from the City
of Edmonton police dep't to assist them with communications in two
of the hardest hit areas. By midnight we had dispatched over 40
amateurs to these sites to assist in locating victims buried in
collapsed buildings, and provide logistical communications support
for the people bringing in food and medical supplies. It is very
obvious that in a disaster of this magnitude no single emergency
service has the ability to handle the volume of traffic generated.
These amateurs continued to assistthe police at the Evergreen
trailer park until late Sunday afternoon.

In addition to the above activities, we set up an emergency station

at the Red Cross offices, and handled over 2000 messages in a 48 hour
period from people around the world trying to find out the status
of freinds and relatives in the disaster area. Part of this traffic
was carried via HF packet links (at a dastardly slow 1200 baud - sorry).

I operated a total of almost 72 hours over that weekend. I don't
recall hearing you volunteer to handle any traffic to the US.

>That's funny, the hams who are currently doing packet radio are doing
>it at 1200 baud. It's in fact illegal to go faster than 9600 baud over
>ham radio in the United States. Ham packet radio was started in
>Canada, where the government didn't get nearly as much in the way.
>It took an immense amount of work in the US just to get the use of ASCII
>legalized over the air -- before that, it was Morse or Baudot or
>nothing. 56Kbit modems are a research project at a few places, like
>Linkoping University in Sweden; Stanford; and at Tucson Amateur Packet
>Radio.

When will the American people realise that their problems are NOT the
rest of the worlds problems? The amatuer services is an experimental
service - if you present a reasonable case to the FCC, you should
be able to obtain a waiver for 56KB operation under the existing
regs. Of course this assumes you're going to do something with it
besides spouting more hot air...
Not *all* hams run 1200 baud. We are currently building a network
through the province running on a 56 KB backbone with fanout at
9600 baud. The Calgary hub will be tied to a network in Ottawa
via a 9600 baud satellite link. I believe similar networks are
already operational in the US.

>>   Mr. Decker suggested extending range by using
>> digital repeaters. Hams have found that in practice using more than two such
>> links in a row tends to bog down, although the newer NETROM modification to
>> the conventional TAPR TNC software seems to be a big help in linking.
>
>As explained above, the ham fraternity knows nothing about networking.
>This is why they are using very lossy links, but with protocols where
>acknowledgement and retransmission only happens end-to-end. This data
>is being relayed at a maximum of 1200 baud -- HALF DUPLEX -- between
>each relay point. If you connect directly (no repeaters), you might
>get 1000 baud since you have to turn the line around once in a while
>for acknowledgements. If you use one repeater, divide by more than 2,
>since each packet has to go to the repeater, then, from the repater to
>the destination. (Each of these hops involves a delay of up to .3
>seconds while switching from receive to transmit, depending on the
>quality of the radio.) Just going through one repeater, you drop under
>300 baud; two repeaters gets you say 100 baud, or 10 cps. That is,
>when all the data gets through error-free. No wonder it "bogs down" on
>more then two links!

Well John, CP/M and Apple DOS 3.x are pretty crude too. I wonder why
the people using these systems are not burning them and running out
to buy the latest, greatest Sun workstations? Could it be that they

are content with what they have? It's funny, but as I look out the
window I see a lot of four and six cylinder cars driving around, but
very few dragsters. Oh well, that's government regulations for ya...

>>   I am saying only that computer hobbyists
>> should not reject the option of pursuing ham radio as a medium for radio
>> modeming solely on the basis of erroneous statements made by someone who
>> obviously doesn't know whereof he speaks.
>
>How about rejecting the option on the basis of MY statements, made by
>someone who DOES know whereof he speaks. I tried it. I still have my
              :-)

>ham license (KB6DQC, technician's). I'm gone though. I'm building
>free software rather than building packet radio networks, because there
>is no government actively standing in the way of building and using
>free software.

Great! You're saving the world! Care to explain why TWO MONTHS after
I sent in my PRE-PAID order for the Gnu distribution tape I still
haven't received it? It took FOUR phone calls to the FSF answering
machine to get someone to call back. This despite the fact that I included
with the order a phone number and email addresses that I could be reached
at in the the event of a delay. I was informed that the FSF had
run out of tapes, but that new tapes were now in and that my tape
would be shipped via special delivery mail that day. That was TWO
WEEKS ago and I still don't have the damn tape! Maybe you should start
a FREE BUSINESS SCHOOL and enroll everyone from the FSF. And no, I don't
give a damn that it's FREE software. You took $200 of my money so you
bloody well better show me something for it!

>   I figure about 20 years' worth of old hams will have to
>die before it becomes possible to do anything interesting with the
>amateur spectrum space. I'd be glad if somebody would prove me wrong.

The world owes you a living? If you don't like it, why don't you
DO SOMETHING ABOUT IT?

>{dasys1,ncoast,well,sun,ihnp4}!hoptoad!gnu   gnu@postgres.berkeley.edu
>My name's in the header where it belongs.

Any your foot is in your mouth...

Summary: 56kbps *is* legal in the US
Xref: mnetor rec.ham-radio.packet:454 comp.dcom.modems:833

I will have lots more to say about the Public Digital Radio Service vs ham radio stuff that has been going on in comp.dcom.modems and is now spilling over into rec.ham-radio.packet, but I wanted to correct one misconception quickly:

There is absolutely nothing illegal about running 56kbps amateur packet radio in the United States. At least I *hope* not, I have two beta-test units designed by WA4DSY in the final stages of construction here, and a number of other units are already on the air in the Atlanta area.

When in doubt, check the FCC rules. 97.69 gives you two options for running digital communications:

1. Conventional Baudot, ASCII or AMTOR "RTTY-style" operations at speeds up to 300 baud below 28 Mhz, up to 1200 baud between 28 and 50 Mhz, 19600 [sic] baud between 50 and 220 Mhz, and 56kbps above 220 Mhz. You can do this either domestically or internationally.

-OR-

2. For domestic communications ONLY, you can run ANY digital code and modulation method you want, as long as it's intended to facilitate communication rather than to hide it from others. In order to encourage the development of bandwidth-efficient modems, under this option you are restricted by bandwidth rather than signalling speed, The limits are: 20 Khz between 50 and 220 Mhz, 100 Khz between 220 and 902 Mhz, and UNLIMITED above 902 Mhz (assuming you stay within the band, of course). If you can make a megabit modem that operates in only 20 Khz of bandwidth, it is entirely legal to run it on 2 meters (although I'd suggest you talk to your patent attorney first). You are also allowed to run spread spectrum (with one of several standard linear polynomials) above 420 Mhz.

Once again, for US domestic digital communications you can do ANYTHING you

want above 50 Mhz within the bandwidth (not signalling rate) limits. So basically there are NO arbitrary FCC limits on the technology we hams can use on the air, as long as it meets the bandwidth limits and you operate it according to the rest of the rules.

I suppose a Canadian can be excused for not being familiar with American rules, but a licensed American ham who expresses strong interest in the development of digital radio is another story...

Phil

To the best of my knowledge, John Gilmore was using the login "gnu"
long before Richard Stallman came up with his cute little
"GNU's Not UNIX" acronym.

As far as I know, John doesn't have anything to do with the operation
of the Free Software Foundation (though I suspect he supports its work).

If you're gonna bitch, at least bitch at the right people.

Now whose foot is in whose mouth?

In the referenced article Lyndon Nerenberg writes:
  [John Gilmore's comments deleted]
>Perhaps you consider federal legislation "mickey mouse." The rest
>of the world (for the most part) does not (thank God). Of course
>in California murder is also a "mickey mouse" law ("don't change lanes
>so close to me a**hole or I'll blow your brains out!").

  Let me see if I follow this. "I've heard that there are people
in California who are nutso enough to take potshots at passing

motorists. Therefore, I can dismiss anything said by a Californian
as nutso." That's not it? Hmmm... Let's try again: "Saying that
some certain Federal regulations are mickey-mouse is similar to
saying that there ought to be no laws." Is that what you meant?
Gee, I seem to be having a lot of trouble following you here.....

>I hate to make you face reality John, but most things in life are
>under control of gov't regulations. It's a good thing there are
>"reactionary spies" to keep people operating within the rules. If the
>FCC is faced with having to enforce the regs in the ham bands, there
>won't be hams bands in very short order (in the US anyway... hey, that's
>not a bad idea).

  Oh, boy, now you've lost me again. Lessee, "because lots of things
are currently regulated by government(s), they *ought* to be regulated."
And "if it weren't for the all-wise and benevolent government's rules,
there would necessarily be unrestricted chaos". Is that what you mean?

>>In contrast, the computer fraternity is seriously radical. New ideas
>>and new people are welcomed. Experimentation is encouraged. If you
>>get a good idea and you do it, people are free to do things the old way
>>or do it your new way. You don't need to ask the FCC whether you can
>>plug a better printer or piece of software into your computer, or whether
>>you are permitted double the speed of your machine. If you can afford
>>to buy it or have enough imagination to create it, you can use it.
>
>The only time you need to ask the FCC about hooking up a piece of
>equipment is when the act of "hooking it up" might effect another
>persons ability to use whatever it is you are hooking up to. If you

>the users on your exchange. If you transmit spurs and/or harmonics
>you are going to bother a lot of non-hams. The regulations are in
>place to ensure that these other users have some recourse in the
>event you interfere with them.

  Hmmmm.... "there is no possible solution to the problem of allocating
and using radio spectrum space except government regulation."

>>I was interested in packet radio as a vehicle for carrying data for
>>computer users. While at least 4 or 5 people in the Pacific Packet Radio
>>Society (the local ham digital-radio group) agreed, the rest of the
>>hams were solidly against the idea of computer users being able to just
>>send their data through the ether without going through all the hassle that
>>THEY had had to go through. They wanted to use their new, experimental
>>packet radios for the same old shit -- ragchewing (ham-ese for shooting
>>the bull over the radio).
>
>Sounds like you want to become a common carrier. If you think getting
>a ham license is so damn difficult, then you should get a license to
>become a common carrier. I would be interested in talking to you
>about the application process when you're done (you should be finished
>in about 1990). The cost of the application should not be a problem.

>As you indicated above, the nice thing about the computing hobby is
>that you can buy anything if you have the money. C'mon John, let's
>see you finance a country wide packet network.

  Clever, switching the subject of the discussion like that. Notice
that John did not allude to "getting a license" (in fact, below he
makes clear that he already has one) but to "the hassle". Red tape.
Bullshit from the Fancy Candy Company. And other HAMs.

  Here, Lyndon goes on at great length about his heroic efforts
during a recent natural disaster, concluding with:

>I operated a total of almost 72 hours over that weekend. I don't
>recall hearing you volunteer to handle any traffic to the US.

  Great. I'm proud of you. I'm sure lots of people are and were
grateful. Now please tell me how that justifies the HAM community's
total monopoly on literally billions of channels of radio space.
Tell me how that justifies locking out the wonderful advances that
are possible by marrying computer technology with radio communications.
  Also, don't bother playing "holier than thou". For one thing, you
won't win, and for another, it smells bad.

   Here, John makes some excellent criticisms of the existing packet
radio networks.... Lyndon replies with:

>Well John, CP/M and Apple DOS 3.x are pretty crude too. I wonder why
>the people using these systems are not burning them and running out
>to buy the latest, greatest Sun workstations? Could it be that they
>are content with what they have? It's funny, but as I look out the
>window I see a lot of four and six cylinder cars driving around, but
>very few dragsters.

  You seem to be confusing John's frustration with the HAM fraternity's
hatred of change, with some sort of desire to "replace everything". As
far as I can tell the latter idea exists only in your fevered mind.

>>   I figure about 20 years' worth of old hams will have to
>>die before it becomes possible to do anything interesting with the
>>amateur spectrum space. I'd be glad if somebody would prove me wrong.
>
>The world owes you a living? If you don't like it, why don't you
>DO SOMETHING ABOUT IT?

   Intriguing. You're the one who wants government regulations to
"protect" your hobby, and you're accusing John of thinking the world
owes him a living? Gee, I think you've lost me again...
   Unlike loud-mouthed clods such as yourself, some of us ARE doing
something about it. Unfortunately, the HAM fraternity (with the help

of it's Big Brother the FCC) is doing it's level best to *prevent*
anyone from doing any development of packet radio with computers.
  Just think, if we could form a club and BUY the rights to a particular
frequency band in a particular geographical area, we could transmit
anything we want (so long as we don't interfere with anyone else, of
course). Just imagine the experimentation that could be done then!
Kinda like the HAMs used to do.... 30 years ago.

Well, you could take some of these advances, build them, put them on the
existing commercial channels, sell the hardware, and retire to that little
island in the sun. There is nothing stopping you, now. The commercial
channels are there.

>   Just think, if we could form a club and BUY the rights to a particular

Kinda like some of the amateur radio folks are still doing.

As for buying a channel, look into commercial radio services. It can
probably be done, if you try.

> development of digital radio is another story...
>
> Phil

Let me add a couple of thoughts to what Phil started here. I also have
two of the DSY 56KB modems and four 9600 bps modem kits (K9NG's) and
will not have to ask anyones permission to put them on the air. As far
as what hams are doing, Gilmore has gotten it all wrong in my opinion

(stick to computer software John when you want to flame).

(1) The ENTIRE amateur radio "network" with very few exceptions is built from equipment that is owned by one individual or a few individuals who have donated the services of THEIR equipment to meeting the needs of others. It is a kludge but their are anecdotal instances of it working very well. I personally send mail to Canada (VE3GYQ) about twice a week and the delivery time has never been more than six hours (New Jersey to VE3) and this is over links that are all 1200 or 300 bits per second. I send mail to California to W0RLI about once a week and it goes 1200 bps to Maryland and then through a 56 Kbps satellite link to California (Frisco) and delivered there. It is a kludge but it does meet some mail needs.

(2) Work is going on to build much better networks. It is heartening to see that Gilmore knows about the work of Phil Karn to produce code for interworking because the only reward Phil is getting for this is the knowledge that people of Gilmore's stature know of and appreciate his work. The TCP-IP-UDP implementation that KA9Q has written is currently running away with what has come to be known affectionately as the protocol wars (as it should) BUT there are other folks working on other stuff (OSI software and "home grown" stuff). We are not standing still while dust collects on our shoulders. Phils later submission concerning the conservative nature of hams is unfair in my opinion in that it singles out hams for this "flame". When was the last time you installed new software that caused some member of your computer community to have to learn as much as a single new command?

(3) AMSAT/TAPR are funding a digital signal processing project which I co-chair with Tom Clark W3IWI whose purpose is to bring the tools of DSP to bear on amateur signalling problems. We are working on all the tools necessary to bring a mini ISDN into being. Software that currently works on the devices we are working on (TMS320 family) provides ADPCM and LPC encoding of voice at 9600 bps rates and W5SXD is working on some TMS340 video compression schemes. I will unveil my software modem at ARRL L.A. Networking Conference (yes we run a conference every year for the purpose of people-networking of those working on a broad spectrum of topics in computer networking). Tom put together an implementation of a PSK modem for use in satellite digital communications and that is being provided in kit form from TAPR for $100.

(4) As for inter and intra continental digital signalling: AMSAT and JAMSAT have together in orbit, working now, two satellites that afford digital communications in some form or another. FO-12, Japan's first amateur radio satellite, has functioning digital repeater software and it also has a a store and forward mailbox on board. The University of Surrey has Oscar-11, which has a digital store and forward capability. Both of these are experimental and do not provide the necessary facilities for major internetworking. HOWEVER, with the development of the PSK modems, and the launch of AMSAT-NA, AMSAT-DL, and others

Phase-IIIC, we WILL be able to move megabits of data on a routine basis. Also on board is a dedicated packet experiment that is a simple repeater but can do some store and forward. Phase-IIIC is currently scheduled for launch in March 1988 and we are gearing up now for our big pre-launch publicity push.

(5) TAPR is funding a hardware project to try and produce a generic networking box and the interest is very high in producing a follow on to this initial effort in which we have a larger set of development tools available to us so that progress will go faster.

(6) The American Radio Relay League's ad hoc digital committee is pursuing and underwriting experiments in signalling working on HF, VHF, UHF, and microwave to find "optimal" solutions for each of these environments.

(7) AMSAT is currently funding a reseach project to design a Phase-IV satellite which has come to mean geosynchronous. The digital (nonlinear hard limited high efficiency etc.) transponder on this is now proposed to be T1 for providing large capacity (as far as ham-radio is concerned) pipes for networking. Tony England, head astronaut on the space station project, is also on the engineering team (Phil K., Tom Clark, Bdale Garbee, and myself are readers of this service on the team) for Phase IV. He wants to use the digital transponder for compressed video in a TDRS style operation as an educational tool.

Look I could go on until this gets really boring (it already is? Sorry :-).

The point is that no one should say that we aren't trying to do better. Don't give up on us yet.

If you are interested in participating in some of the projects or want to be put in touch with those who can put you on the project please feel free to call me at home

(609)-443-8963 after 8 PM Eastern and before 10 PM Eastern

I don't mind putting people to work :-)

Bob N4HY

********** The Radio Amateur Telecommunications Society **********
********** Information Bulletin 20 August 1987 **********

To: All Radio Amateurs
Fm: N2DSY @ KD6TH-4/201
Sb: COSI-Switch and RATS Update

The delays in getting out the COSI-Switch have been long and
somewhat frustrating for everyone. Things are finally coming
together.

What should be clear to everyone by now is that the originally
announced X.25 Level 3 code has not arrived.

Something had to be done...

The project has been started from scratch by Tom Moulton, W2VY.
He is getting consultation support from John Howell, N2FVN,
Harlan Worchel, KB2CNL, and Gordon Beattie, N2DSY. All of these
individuals have previously implemented X.25 switches or Packet
Assembler/Disassemblers (PADs). We had a design review on the
14th of August and we are all quite pleased with the progress
Tom has made. (Kudos to TOM !)

The revised delivery scedule is as follows:

1 Oct - Alpha testing of a completed COSI-Switch Level 3 module

1 Nov - Beta testing of a completed COSI-Switch machine - TNC-2/DR-200
(Any other hardware suggestions ?)

1 Jan - Production shipment begins

All individuals and clubs that contacted RATS regarding this project will receive MS-DOS Disks and EPROMS with the code during each phase of the testing cycle. We got a good deal on diskettes and EPROMs so we will include everyone ! The production version will include SOURCE in "C".

As with all the SOURCE we distribute, it is free for non-commercial use.

--- Delete the following before transmission over Amateur Radio networks ---

Support contributions are accepted and commercial licensing arrangements can be made. Contact RATS for details.

------------------- END DELETE --

ALL proceeds go to the enhancement of the Packet Network.

Other happenings:

John Howell N2FVN has produced an implementation of the "Asynchronous Framing Technique (AFT) in "C". This is useful for providing error-checked, transparent HDLC links through asynchronous interfaces. AFT can be run over seven or eight bit networks and handles HDLC frames transparently. It is a nice building-block for the network.

This AFT is a generic implementation (accompanied by a "DOC" file) that includes code that runs under MS-DOS. Distribution of this code, in compressed form, will be via Amateur Packet Radio, Usenet and CompuServe HAMNET. The file name(s) will be based on the string "AFT10" for AFT version 1.0. It will be distributed in compressed form. We'll send it out with the first COSI-Switch test code.

John is working on a matching capability for the TNC-2. This would provide a error-checked link between PCs and TNCs. Harlan Worchel, KB2CNL (yes, a NOVICE !) is working on porting the code to the Commodore 64.

Brian Riley's (KA2BQE) latest release of the Packet Radio MailBox System, version 95c, supports forwarding through COSI-Switch, GatorSwitch and NET/ROM. It also has the "KT" (kill traffic) feature that will automatically generate a service message when a traffic message is removed from the packet network. It is available from RATS, with the "C" SOURCE CODE. Send a message to N2DSY @ KD6TH-4/201 or KA2BQE @ KA2BQE-4/609 to get a copy of the code.

RATS is currently beta-testing the GLB Netlink 220 19.2 KBps modem/radios. So fast ! Sooo goood ! We are also burning-in eight PAC-COMM DR-200s. These will be deployed shortly.

RATS wishes to thank you for your patience. We're not real
happy with how we got into the Level 3 COSI-Switch delay, but we
think the effort is on the right track. If you have any
questions call or send me a message.

Hang tough. We think you'll like the output !

Next update will be sent on or about 15 September.

Vy 73,

J. Gordon Beattie, Jr.

INFORMATION AS OF 29 JAN 1988

!!!!!!!!!! INFORMATION SUBJECT TO CHANGE !!!!!!!!!!

****

CLUB: Northern Vt. Winter Hamfest. EVENT: Flea Market and Auction
PLACE: Milton High School, Milton Vt. DATE: 27 Feb 1988 (SAT)
DEALER SETUP: 0830 OPEN TO PUBLIC: 0900 until 1500
ADMISSION: $2.00 TABLE PRICES: No extra charge to sellers
TALK-IN: 145.47- and 146.85+ REFRESHMENTS:
OTHER NOTES: The Milton High School is conveniently located on Rt. 7 in the village of Milton, 4 Miles north of exit 17 off I-89. Plenty of free parking Avail. There will be FCC exams Avail. (no per-registration is needed for exams) For more info call 802-879-6589 in the evenings.

****

CLUB: York Winterfest EVENT: Flea market
PLACE: Dover, PA. DATE: 06 Mar, 1988
DEALER SETUP: OPEN TO PUBLIC: 0800
ADMISSION: $4.00 TABLE PRICES: $10.00
TALK-IN: 146.37/.97 and 147.93/.33 REFRESHMENTS: YES
OTHER NOTES: The event is at the Dover Fire Hall, Dover, PA. There is FREE Tailgating and two floors inside. The XYL is FREE. For advance info. Write YORK WINTERFEST, 2449 Heidlersburg Rd. Gettysburg, PA. 17325, or call 717-528-8412.

****

CLUB: ICRC A.R.C. EVENT: Flea Market
PLACE: American School for the Deaf DATE: 20 March 1988
DEALER SETUP: OPEN TO PUBLIC: 0900 to 1400
ADMISSION: TABLE PRICES: $10.00 in advance.
TALK-IN: 146.28/.88 REFRESHMENTS: Yes
OTHER NOTES: Take Rt 84 to West Hartford area, the school is on the Rt 84 Exit sign. American School for the Deaf, 139 N. Main Street. Contact Chuck Motes K1DFS at 22 Woodside Lane, Plainville. Ct. 06062. Telephone 203-747-6377.

CLUB: Framingham A.R.A. EVENT: Flea Market
PLACE: Framingham league Center DATE: 10 April 1988
DEALER SETUP: 0830-1000 OPEN TO PUBLIC: 1000
ADMISSION: $2.00 TABLE PRICES: $10.00 in advance
TALK-IN: 147.75/.15 REFRESHMENTS: Yes

OTHER NOTES: For Flea Market info. call Jon, K1VVC at 617-877-7166. Table price includes 1 admission. For advance table reservations send check to Framingham Amateur Radio Assoc. 37 Lyman Road, Framingham, Ma 01701. >From Rt 128 go West on Rt. 9 from Rt 495 go east on Rt 9. Take Rt 126 south towards Downtown Framingham, (about 2 miles). after the traffic signal near Dunkin Donuts, the Civic League is 2nd and 3rd buildings on the right. Parking is nearby.

****

CLUB: South Shore A.R.C. EVENT: Indoor Flea Market
PLACE: Viking Club, Braintree Ma. DATE: 10 April SUN (RAIN OR SHINE)
DEALER SETUP:0900 OPEN TO PUBLIC: 1100 until 1600
ADMISSION: $1.00 TABLE PRICES: $10.00 in advance
TALK-IN: REFRESHMENTS: YES
OTHER NOTES: The Viking club is at 410 Quincy Ave, Braintree, Ma. Tables are $10.00 in advance (includes 1 free admission) before 7 April. For more info contact Hal Jones WB1ABM, 48 Saning Rd., North Weymouth, Ma. 02191. Tables are $12.00 on the day of the Flea Market, but there is no guaranteed table space. make checks payable to South Shore Amateur Radio Club, confirmation check receipt will be sent. No cancellation refund after 7 April. Questions may be answered by calling 617-335-57777 (Hal) in the evenings.

****

CLUB: Southington A.R.A. EVENT: Flea Market
PLACE: National Guard Armory DATE: 17 April (SUN)
DEALER SETUP: 0800 OPEN TO PUBLIC: 0900 until 1300
ADMISSION: $2.00 TABLE PRICES: $8.00 in Adv. $10.00 Adv
TALK-IN: 146.28/.88 and 146.500 Sx. REFRESHMENTS: YES
OTHER NOTES: The event in in Southington Ct. at the National Guard Armory at 590 Woodruff Street. Tables are $8.00 in advance (before 13 April) or $10.00 at the door. Two persons admitted with each table purchased. For more info. contact Chet, KA1ILH from 1700 to 2100 at 628-9346.

****

CLUB: Montachusett A.R.A. EVENT: Flea Market
PLACE: George Wallace Civic Center DATE: 24 April 1988 (Sun.)
DEALER SETUP: 08:30 OPEN TO PUBLIC: 1000 until 1500
ADMISSION: $2.00 TABLE PRICES: $10.00
TALK-IN: 144.85/145.45 and .52 direct REFRESHMENTS:
OTHER NOTES: For table reservations contact, James Beauegard, KB1AY, 7 Mountain Ave, Fitchburg, Ma. 01420. The event in in Fitchburg Mass.

CLUB: Dayton Hamvention EVENT: Hamvention/flea market
PLACE: HARA Arena DATE: 29,30 April and 1 May
DEALER SETUP: Friday OPEN TO PUBLIC: Friday at noon.
ADMISSION:$8.00 early $10.00 at door TABLE PRICES: $23.00 for 1 space
TALK-IN: REFRESHMENTS: Plenty
OTHER NOTES: For General Info call 513-433-7720 or write PO. bx 2205 Dayton Ohio. For Flea Market info call 513-898-8871, Foe logging info call 513-223-2612, no reservations by phone. Spaces are $23.00 for one, $50.00 for

two adjacent or $150.00 for three Adjacent. Make checks payable to Dayton Hamvention, box 2205, Dayton, Ohio 45401. There is a maximum of three spaces per person (non-Transferable) Ticket (valid for all 3 days) will be sold in ADVANCE ONLY. NO spaces sold at the gate. Vendors MUST order registration ticket when ordering Flea Market spaces.

****

CLUB: HOSS TRADERS EVENT: FLEA MARKET
PLACE: Kingston N.H. Fairgrounds DATE: 07 May. 1988(SAT)
DEALER SETUP: Anytime OPEN TO PUBLIC: All night Friday & Sat.
ADMISSION: $5.00 TABLE PRICES: $5.00
TALK-IN: 146.40/147.00 or .52 direct REFRESHMENTS: LOTS
* NOTE!!!!! THE HOSSTRADERS SWAPFEST WILL BE HELD IN THE SPRING ON 7 MAY 1988 *
* BUT IT WILL NOT BE HELD AT THE DEERFIELD FAIRGROUNDS. THE NEW LOCATION IS *
* KINGSTON FAIRGROUNDS, KINGSTON, N.H. AT THE SOUTHERN JUNCTION OF RT 111 AND *
* RT 125 IN KINGSTON. *
OTHER NOTES: RAIN OR SHINE (ANNUAL SPRING SWAPFEST) Friday night camping starts at 1600. Profits benefit the Boston Burns Unit of the Shriner's Hospital for Crippled Children. Flea market open at 0600 in the morning Sat.
Children. Questions can be answered by sending an SASE to Joe Demaso, Star Rt. Box 56, Bucksport, Me. If you plan to camp on the Fairgrounds your camper should be self contained, also there are three commercial camp grounds within walking distance of the fairground.

****

CLUB: Mid Coast ARC Inc. EVENT: HAMFEST
PLACE: Fairgrounds, Union, Me. DATE: 16 July 1988
DEALER SETUP: OPEN TO PUBLIC:
ADMISSION: TABLE PRICES:
TALK-IN: 146.88 or 146.985 REFRESHMENTS: YES
OTHER NOTES: There will be a Lobster/Clam bake, Young adult programs, ladies programs, Swap tables, tail gating, Commercial dealers, Arts and crafts, net meetings Packet Radio Demos, Camping, Museum of Maine Heritage, Pot Luck Supper, and entertainment. For More info contact Lynda Hawke, KA1FKS, at 198 Cony Street, Agusta, Me. 04330. (Tel. 207-623-2427). Packeteers can leave a message for KQ1L @ KA1NNN. NOTE commercial Dealers contact Win Jackson P.O. Box 213, East Winthrop, Maine 04343.

Summary: Hey!!!

Come on, let's have a rational discussion here. You have made the point
already that it is easier to get a Novice ticket than it is to get
into the average college fraternity (this is true...). There is no
reason to go on and on about it. Getting antagonistic doesn't help
anything. It just sends a message to non-hams that we are an elitist
society with our noses higher than our scalp-rugs. Unfortunately,
some actions the ARRL take help to give this impression. They
don't need your help to give us more bad press.

(more "suggestions" deleted)

Way to go, Erik. You've just shown Patrick what an open, helpful,
friendly fraternity the ham radio community is :-). Seriously Patrick,
there is a LOT you can learn from ham radio, and there are a LOT of
friendly, open people out there who will be more than happy to help
you. Hams are (justifiably) proud of their hobby, but that shouldn't
keep them from helping other non-ham radio enthusiasts. Venom aside,
Erik's advice is sound. Get an amateur license and REALLY start
enjoying radio! I'm glad I did.

Summary: Not all CBers are bad.

In article <1943@ttidca.TTI.COM>, sorgatz@ttidcb.tti.com (Erik Sorgatz) writes:
>CB radio is a sewer, the majority of CB
>users are braindead, burntout Kids that have so little to do with their

>miserable lives they congragate around the 11 meter band hoping for any
>kind of amusement.

I occasionally read rec.ham-radio. When I find an occasional
article on CB radio, it is generally blasting the CBers. This
attitude upsets me.

I am a member of a CB club based in the San Fernando Valley
(Greater Los Angeles), California. The legal name of this club
is "Valley CBers Inc." -- informally it is called the "Over the
Hill Gang". The purpose of this club is threefold:

    1) to exchange traffic information on the I-405 freeway
    during rush hours -- this benefits not only club members but
    others who monitor channel 14 (the channel the club uses).
    This is a form of SERVICE.

    2) to perform a SAFETY service, by notifying base
    stations (either REACTS or club members with base stations or
    cellular telephones) of traffic accidents that do not have police
    or ambulances on the scene.

    3) to provide a SOCIAL outlet for club members -- garage
    sales, hayrides, picnics, spagetti dinners, etc.

The club has over 200 members, I think. The occupations of these
members range from professionals such as lawyers or engineers to
auto mechanics to small business owners to ... you name it.

As with any medium, it is the special cases that bring about a
reputation. Yes, there are twits on the airwaves. There are
people who like to blast across the country with their power.
There are twits who like to send dead carriers and misuse the
airwaves. We don't like them either.

But it is wrong to characterize the entire users of the spectrum
as "braindead, burntout Kids". Would it be correct to
characterize ham radio users as braindead, burntout engineers? :-)

I agree with the comments in this reply except for one. And this seems to be the most prevalent idea every time the concept of license free packet is brought up. Everyone immediately jumps in here and says "Get your HAM license". Of course they are missing what is probably the biggest point in the whole discussion. The people asking for a Personal Digital Radio Service don't want to be hams. They have no interest in ham radio and probably the most important idea being missed here is that what they want to use packet for would be illegal over amateur radio. Take a look at what is on the various phone BBS's. They are loaded with shareware, for sale ads, and advertisements for various commercial products. All things definitely out of place on amateur radio.
One of the items always brought up when people try to justify the continued existence of amateur radio is the idea of what we were originally chartered to do. And one of these is to develop new means of communication. It now seems like the majority of hams have decided we are developing this stuff for our own personal use.
I believe it was hams who pioneerd such technological breakthrus like SSB, FM, and REPEATERS. These ideas have since proven their value in the commercial world and are now considered just a part of the world we live in. The time has come for packet to take it's place in the world too. There is no reason why, in a few years, it can't be commonplace for there to be a packet box hooked up to the PC in every house. Maybe this is the technology it will take to finally bring services like TELETEXT into the home.

Any comments on this diatribe will be accepted.

 << and a bunch of other stuff about this public-spirited group. >>

 Yes, you are correct. The OTHG is a stunning example of the usefulness
that CB radio can provide. My congratulations on the exellent service
that it gives our community. I have listened in on ch 14 from time to
time myself and found the traffic reports quite useful. It is this kind
of exception, however that proves the rule. Listen to ch 14 _AFTER_ 8pm,
listen to some of the, ahem, 'offspring' using MOM&DAD'S base, listen
to the wonderfully glowing dialect, the use of such proper language...
..some of these little marvels are growing up in homes where the CB is
used by the MOM&DAD to communicate on ch 14 on a daily basis...do I

need to remind you about some of the interesting infighting that goes
on in the L.A./Valley on 11 meters?? About some of the beautifully
caring events that result when the "ROGE-O's" and the OTHG had-it-out
over "DXing" on ch 14 during 'mobile time'??....I'm sure you remember
that stuff..
>

 You're absolutly right. There couldn't be more that few million four
letter words used on CB in a given day...;-) Tell you what, listen to
ch 23 or ch 26 some evening...listen to all the inane truckers that
just cannot seem to remember that 31-40 are used for sideband in L.A.
and then ask yourself how the 'Band would sound with the buzz of
packet radio added, fed into a General MC9, bloody-widebanded A.M.
rig, with one of those Wunnerful 10-sweep tube "linear" amps that
all the 'Big-Straps' run...wouldn't that just sound 10-8!?? :-)
>
>But it is wrong to characterize the entire users of the spectrum
>as "braindead, burntout Kids". Would it be correct to
>characterize ham radio users as braindead, burntout engineers? :-)
>
 You're right, I should have added a scalar-K to reference the
true picture, and I should have mentioned that there are some
clubs, groups and individuals (like OTHG, and yourself, obviously)
that are using the 11 meter band for it's intended purpose, and
without violating part 95. I think that the constant would be a
number VERY close to 1.0....unfortunately.
>Daniel Faigin   --- "Otherbeast" ---   OTHG Channel 14
>
 yeah, great, I used to have one of those too...now I'm just me...
..unless I get on ch 26 to politely ask the kids to please stop
running their amps so loud that I can't hear 10 meters..;-) Then
I'm --- "The Infinity" --- '73 Dan and here's hoping you will
at least consider upgrading to Amateur Radio, not everyone up
there is as gruff as I am. cul.

Right. Two Comments...
First, that is EXACTLY why I would like to see a personal packet
network using some frequencies other than amateur. There are LOTS of
things that I can legally talk about on CB that I can't talk about
on amateur radio such as business communications, etc...
In fact, one probably couldn't read most of these articles on an amateur packet
channel due to their contents.

Secondly, the reason that I proposed CB channels instead of some NEW
set of channels, is that it is very unlikely that any new VHF/UHF
channels are available for a public packet network. I would prefer
the top part of CB being taken for packet, instead of the top part
of 6 meters.

Matthew Kaufman, KA6SQG
  (matthew@ucsck.ucsc.edu) (...!ucbvax!ucscc!ucsck!matthew)

p.s. I started this discussion about allowing packet on CB...
please don't tell me to go out and
get a ham license... I already have one. Thank You.

 Real good. *NOW* we come to the crux of the matter.

    1) NOT INTERESTED IN AMATEUR RADIO.
    2) COMMERCIAL INTERESTS THAT PRECLUDE THE USE OF SAME

 Sounds like what these guys need is a telephone, huh? What they're asking for
is all the flexibility of Amateur without those nasty restrictions, tough.
 Until some astronomical occurance, this is not gonna happen. The use of
radio spectrum, as an experimenters hobby-zone is defined as Amateur Radio
Service, what they want is Commercial or Fixed Service. BTW: It usually costs
more than a telephone. And has some nasty restrictions about not competing
with the telephone system, etc.

>I believe it was hams who pioneerd such technological breakthrus like SSB,

 Yeah, right. Well, why not just get a cell-phone portable @ 800 Mhz and plug
in your modem, plug in your P.C. and wail??!!! Or is the real point here the

cost of doing exactly that?? The breakthrus that opened shortwave were indeed pioneered by Amateurs, in fact the whole spectrum from 200 meters down was ours at one time. The commercial interests put their stations into the HF bands ILLEGALLY! No fines were issued, noone went to jail tho...typical of the political machine to "sell off" something they don't own or have already "given" rights to...without recompensation. Absurd. Hey, if a cellular fone is too expensive, I guess they'll just have to rely on the twisted-pair, huh? Teletext is already in a lot of homes, via the phone lines, you don't need packet radio for that; it's a commercial service provider, and you pay for such things. At least according to the current FCC regs. Hell man, we can't order a pizza via auto-patch! Why should unlicensed individuals be exempted from the spirit of the laws?? Go ahead, explain.
>
>Any comments on this diatribe will be accepted.
>(I have my NOMEX underwear on :-)

Nahh, come on OM, we're all in this together; besides I used up my monthly supply of <<FLAMES!>> on those CB nerds! ;-) The fact is the telephone Co. monopoly precludes such things, the Amateur's are not gonna let one Hz of bandwidth get sucked-up for such stuff, and the CB community would start tearing 27 Mhz packet-ops a new rectum the first time they heard a BRAZAPPP! -it's a no-win proposition! The real stickler is the commercial interests on the dial-up BBS's, this has no place in a hobbyist-radio service, licensed or not..unless...you wanna open a bigger can of worms...and start looking at (DRUM ROLL PLEASE!):

  P A Y C B....! UGH, shades of GMRS! (spatooie!)

 The BBS interests that offer products for profit would then be taxed at some horrible rate to offset the public-trust of being allocated spectrum space..just like the telephone company..oops! What about that? Is Ma Bell (and those 6.02 x 10EE23 de-monopolized locals) gonna stand for such a run for their money?? The answer is (MAY I HAVE THE ENVELOPE?): "not bloody likely!". So, you see, the interests against such things as this are mostly the commercial status-quo, the Amateur community is almost a "friend" by comparison! ;-)

                               ^^^^^^^^^
I think that your comments to Mr. Tully are childish and uncalled for.
It is attitudes like your's that turn many potential Hams away from the
hobby. All of the terms that Patrick used are acceptable in everyday
conversation and are heard on the ham bands daily. Had he been writing
a term paper or thesis, then the flames would be vaild, but this group
is informal (remember REC.ham-radio ?).
I think that a posted apology is in order.

>or perks to the 11 meter crowd, so grow up! Get into real radio...

Looking out the window at the overcast, a thought comes to me. Diffuse infrared systems have been built that work quite well indoors, bouncing the signal off ceilings and walls so that line of sight is not required. Why not try diffuse infrared off the cloud deck as a scheme for short-range outdoor communications? Ranges of a few blocks might be possible. One could extend this with repeaters. There would be fading during good weather conditions, but in areas with smog and haze, the atmosphere may never be transparent enough to prevent operation.

Laser safety standards should not be a problem, since the beam is diffused very widely and the peak energy per unit area, the regulated quantity for lasers, will thus be very low. Detection will require heavy filtering, both optical and electronic, but with narrow-band optical interference filters, negative s/n ratio modulation techniques, and packet error correction, communication should be possible.

Incidentally, all the necessary optical components, including interference filters, are available from Edmund Scientific.

No FCC licence is required for "blinking light signals", of course.

> ... There is no reason why, in a
> few years, it can't be commonplace for there to be a packet box hooked up
> to the PC in every house...

Actually, yes there is: choose a reasonable set of assumptions about how many such boxes there are and how much traffic each one sends, and then ask yourself how much spectrum space is necessary for this! Don't forget the desire for both interactive use, i.e. low and relatively constant latency, and fast bulk transmission. Then ask yourself whether there is any reasonable part of the spectrum with that much free space. Nope.

Moreover, this is a silly way to do things. Radio is ideal for mobile communications and broadcasting; using it as a substitute for wires between two fixed points in a metropolitan area is dumb, not to say wasteful. You can already buy a box which has many of the desired properties and needs no spectrum space whatsoever! It's called a Telebit Trailblazer, and it gets 14kbps over normal phone lines. If you believe the ISDN enthusiasts, even this is small potatoes compared to what will be available soon.

There is, actually, reason for interest in packet radio links of this kind. Not for computers in houses, but for laptops and their fancier successors (e.g. the fabled Dynabook). Unfortunately, such systems tend to want even more spectrum, and it just isn't available. What we may end up doing is using broadcast optical (infrared) communications, which works fine at short ranges in suitably-equipped areas. If your Dynabook works in your dorm room, in the library, in the study halls, and in the classrooms (or non-academic equivalents of the above), it will be less important that it won't work -- or at least won't talk to the outside world at high speed -- from the beach.

Summary: Blinking light signals == Amateur radio

In article <17327@glacier.STANFORD.EDU>, jbn@glacier.STANFORD.EDU (John B. Nagle) writes:
> No FCC licence is required for "blinking light signals", of course.

Wrong. Amateur radio has "all above" a certain frequency, which includes infrared, visible, ultraviolet, and gamma-ray light.

Often wondered if light bulbs needed CW identifiers.

     The FCC lost that one in court some years back, I think. In the
late 1960s, when the first laser data links were being set up in
Cleveland, the people involved looked into this and discovered that

the FCC had lost a case involving "blinking light signals" some time before. Lasers are regulated by the Consumer Product Safety Commission.

Keywords: DESQview raw mode, Dan Frank's complaint

Dan Frank (dan@speedy.WISC.EDU) wrote on Feb 2nd that he got very poor service from QuarterDeck. I just bought DesqView and along with my registration I sent them a copy of Dan Frank's posting (copy at end of this posting). The following is the reply I received from Quarterdeck. Please excuse the length of this posting and any typos.

Personally, I was indeed very happy to receive this letter, it restored my faith in user support.

Please post followups to comp.sys.ibm.pc (I do not subscribe to ham-radio.packet. You may also e-mail me (address at end).

Quarterdeck Office Systems, 150 Pico Blvd., Santa Monica CA 90405
Feb 19, 1988

Indra Singhal,
Santa Clara, CA,

Dear Mr. Singhal,

Thank you for bringing to our attention the message from the USENET system. We are sorry Mr. Frank was dissatisfied with our customer service. We are a small, but growing company. We have pu a number of new tech support people on recently, but there are still times when teh phone backs up and users have to wait. While I dont offer this as an excuse, it is true that most successful software companies, new or established, occasionally have this problem.

I also must mention that Mr. Frank has never sent in his DESQview registration card and while we do not refuse to talk to unregistered users, this does not help to push you to the top of the queue.

We have not had any significant number of reports of problems with programs utilizing the raw mode, but if Mr. Frank would like to contact me, I would be happy to talk to him about his problem. If you can get his voice number, I would also be willing to contact him about the problem.

If he is a programmer and can produce a short test program that demonstrates the problem and would be willing to send it to me or upload it to our bulletin board system, it might help in isolating the problem.

The Quarterdeck Bulletin Board system operates 24 hours a day, seven days a week. The telephone number is (213) 396-3904. Supported baud rates are 2400/1200/300. Preferred communitations parameters are 8-N-1. You should plan to download using one of teh following error-free protocols: XMODEM, XMODEM CRC, YMODEM or KERMIT.

Thank you for your interest in DESQview.

Stan Young, TEchnical Support, QuarterDeck Office Systems,
(213) 392-9701.

=>Newsgroups: rec.ham-radio.packet,comp.sys.ibm.pc
=>Subject: Desqview bug, Quarterdeck "service"
=>Date: 2 Feb 88 22:04:27 GMT
=>Reply-To: dan@speedy.WISC.EDU (Dan Frank)
=>
=>   There is an interesting bug in the latest version of Desqview. Apparently
=>DV doesn't do a very good job of keeping track of console "RAW" mode status.
=>Sometimes a program is started in raw mode that shouldn't be, and other times
=>you can't get DV's console driver to go *into* raw mode when you need to.
=>The upshot is, there are some very simple, well-behaved programs that don't
=>work right under Desqview (one of the them is the BM mail program used by
=>amateur radio tcp/ip'ers).
=>
=>...
=>   Fool that I am, I thought Quarterdeck might be interested in fixing this
=>bug. For all I know, their technical people might be, if there were any
=>way to reach them. Quarterdeck is one of those companies who apparently
=>hired psychologists to tell them how to discourage people from ever, ever
=>bothering them for service.
=>
=>   I've been trying to call them on their non-toll-free number for about a
=>week, and getting constant busy signals. Finally today I reached their
=>telephone answering person. She put me on hold for tech support, and for
=>the next 20 minutes I was treated to a rather expensive conversation with
=>their computerized telephone system. Finally I accidentally failed to
=>push the proper combination of keys to stay on hold, and was zapped back
=>to the telephone answering person, losing my place in the queue. Exasperated,

=>I explained that I didn't need help installing the program or running
=>Dbase; that I was a software developer and wanted to report a real, live
=>bug. I was put through to a sales manager. She listened politely while
=>I explained my problem, then immediately zapped me back to the telephone
=>answering person, who said, "Please hold for tech support."
=>
=>   "Wait a sec," said I. "Does this mean you put me back on the end of
=>the queue, and I spend *another* twenty minutes talking to your phone
=>system?"
=>   "I guess so," she answered. At this, I became a bit upset. "Look,
=>I have spent a lot of money on this call, to be put back at the end of
=>the queue. I don't need help installing the stupid program. It has a
=>bug, and I'm trying to report it."
=>   "It seems," she answered in a *very* snide voice, "that *everyone*
=>who calls us has a bug." Well, this was the last straw. I demanded
=>to talk to the president's secretary. "You wouldn't be permitted to
=>do that," she said. When I began sputtering something in return, she
=>said, "I'm going to put you on hold until you calm down." *click*.
=>I tried to call back, but of course, I got a busy signal.
=>
=>   I've heard people say that, for example, Microsoft has bad customer
=>service. Microsoft may not be great, but I have never, ever been treated
=>like this by them, or for that matter any other software company before.
=>For all I know, Quarterdeck has *no* support people at all, and simply
=>abuses their customers until they give up. Can anyone top this?
=>
=>   -- Dan

>Daniel Faigin   --- "Otherbeast" ---   OTHG Channel 14

As another member of the "Over the Hill Gang", I thought I would add
my $0.02 to this discussion. I do a *lot* of work-related driving for
my job, alone. So does my mom. I can get help anywhere on the LA freeways
a *lot* faster by using my rig than by getting to the "one every 1/4 mile
call box" on the freeways. I know which channels the twits are on, and
where the serious drivers are. I have saved much time and aggravation
by getting traffic reports from other OTHG members on the 405-corridor
(one night, it saved me at least 45 minutes -- someone told me not to
get on the freeway at my normal spot -- I didn't -- and he was still
several miles back by the time I got home), and from truckers on many of the
other routes that I travel (being a lone female *does* have a few
advantages when it comes to dealing with MCPs ;-).

I enjoy the social aspects of the club, and the traffic reports help. Last
week, we called someone on a base to get a hazardous driver removed from the
road. The CHP know us, and when we call in, they respond. I also
discovered (by accident) one morning that LAPD regularly monitors OTHG

reports -- seems that someone we know as K9 is actually the human half of an LAPD K-9 unit (with police band back-up). Would the LAPD and CHP regularly respond to the rantings of a bunch of "brain-dead kids"? I sincerely doubt it.

One other question for those of you who hate CB so much: what would you say about those of your own (hams) that use CBs? I know several members of the OTHG who regularly use Channel 14 until they get close enough to hit the Valencia 3m repeater with their low-power mobiles (T.O.M., where are you when we need you?)

Karen Davis -- "Silver Lady" -- OTHG Channel 14

One solution for providing a packet band without taking anyone's spectrum is to allow the use of any unused UHF television channel in an area. Even in large cities there are hundreds of megahertz available for this. Just make it clear that any channel can be taken away if needed for T.V. If the packet modems were able to switch to any channel then it would not be any trouble to go to a new channel, and anyone trying to send into a T.V. channel would never key up since the channel would always be busy with the T.V. signal. Also since UHF is rather line of sight there shouldn't be much problem with interference with other cities that have a different UHF assignment.

I too have not been happy with Quarterdeck's response. I
reported the same bug as Frank just before Christmas and was
told by the supervisor of the support group that they would
have the programmer call me. Several weeks went by and I called
again. This time I had to wait on hold for 20 minutes but finally got hold
of the "expert". They had never heard of the raw mode console bug and
didn't really sound like they wanted to test for the problem.
I asked why I never heard from them and the answer was we called once
and no one answered. I have an answering machine on my desk and never
got a message.

I was asked if I was a registered user and gave them my
them serial number. Their files show no record of that number
even though I sent in the card and had the real copy in front of me.
They also informed me that 2.01 went out to all the 2.0 customers.
The 3 registered users I know never received any copy. I was told
they would send me 2.01 to see if that had the bug had been fixed.
Its been 4 weeks and no repsonse. I have been calling a few times
a week for 2 weeks and can't get though since their line is always busy.

In summary I am not very happy with Quarterdeck's support and
attitude of the support personal.

I plan to chat with Mr. Young, as soon as I can get through on the phone, and if that incredible receptionist will "permit" me to speak to him. I'll report back if anything good happens.

I do want to add, though, that after my last encounter with them, I mailed Quarterdeck a problem report, along with a diskette with three demonstration programs on it, including .dvp files for each. They sent it back without looking at it because they didn't have a registration card on me.

Now, let's understand what that means. I *was* registered owner of 1.1. I bought my upgrade directly from Quarterdeck. I have a valid serial number. Instead of holding the diskette and problem report and mailing me a note asking for my card, they just shipped the whole thing back. Does that make sense? I can only believe that those procedures exist to defer until the last possible moment any examination of possible problems with the product.

Why, you may ask, did I not send in my registration card in the first place? Because I wanted to take advantage of that special offer for the alarm clock program, but I was darned if I was going to send them any more money until they stopped jerking me around. Oh well. No alarm clock, I guess.

By the way, the raw mode problem has been reported to Quarterdeck before by others, and their response is always, "Gee whiz, we don't get many complaints about that. Tought luck."

-- Dan

p.s. I did receive a few responses to my posting from others who

had similar experiences. The one common denominator is that everyone
who has ever dealt with that witch on the telephone *hates* her with
a deep and abiding passion.

There would still have to be some type of frequency co-ordination
to prevent intermod interference to existing primary users of the
spectrum. Given that broadcast video is AM I don't think it would
take much power at the packet transmitter to screw up all the TV's
for several blocks around if you pick the "right" frequency.

Of course if you don't have any UHF TV stations around (like us) it
shouldn't be a problem...

Anybody who needs a multitasking and/or multiuser OS these
days should have a look at Digital Research's Concurrent DOS.
(Don't confuse it with things like PC-MOS). It supports DOS
3.3 and there is a special version for the 386, i.e. no need
for EMS or EEMS on a 386, the normal system memory can be
used. On a 8086/8088/80286 kind of machine you can install
up to 8 MB of EEMS memory, totaly transparent to the applications.

Those of us in urban settings can also use diffuse infrared off tall
buildings (artificial clouds!). At one point I seriously thought of
trying this as a way to get a fast link between my home and work, but
the combination of having moved to a less favorable location and having
acquired a Telebit Trailblazer has made me shelve the idea for now.

 The Radio Amateur Telecommunications Society has several
pieces of software which we are willing to place here in both
source and executable form. We have a few questions for the
crew before we proceed.

1. We would only send it via a single distribution/newsgroup,
   which one ?

2. Since binary is not acceptable what form is most welcome ?
   (we have been thinking of the PC BTOA programme if it is
    popular. Should we use a UNIX utility ?)

3. We will also post the DOCUMENTATION...should we pack it up
   or since it isn't too large just post each file ?

4. Is there any demand for the source ?

Comments anyone ?

By the way, the mailing has started to flow out the door...
We would like to post the stuff here to help distribute the
software more rapidly.

Thanks,
            J. Gordon Beattie, Jr.

I personally prefer source because that way it can be adapted to various
machines and various other oddities. A lot of times I find source easier
to understand than documentation. Besides I was born and raised on UNIX
version 6, I love source.

Subject: Asynchronous Framing Technique Document File: AFT.DOC
Message-ID: <1972@hou2d.UUCP>
Date: 7 Apr 88 19:37:26 GMT
Organization: AT&T Bell Laboratories, Holmdel
Lines: 357
Keywords: AFT, a SLIP alternative

Here is the document file that I promised last week describing
the Asynchonous Framing Technique (AFT). This is only a
framing protocol. It contains NO state machine, transparency

and error control.

Four files will follow this message(but only in comp.protocols.tcp-ip):

1. AFT.C - a machine independent implementation of the AFT software.
2. ASYNC.ASM - an MS-DOS device driver to use with AFT.
3. TEST1.C - a test and demo programme for the AFT software.
4. Test2.C - another test and demo programme for the AFT software.

The file contained in this message is AFT.DOC.

If you like what you see here in the document file, go to the newsgroup "comp.protocols.tcp-ip" and pull the other four files.

Machine Independent Asynchronous Framing Technique (AFT)

Version 1.0, by John Howell (N2FVN), August 7, 1987

This software is in the public domain. It is provided on an 'as is' basis without warranty.

This is a portable implementation of the Asynchronous Framing Technique for X.25 (X.25/AFT) Revision 2 coded in the C language. AFT is a protocol which allows X.25 style framing to be done over an asynchronous communication channel. It allows for detection of the start and end of frames, detection of corrupted transmission, and sending of frames containing eight bit characters over communication links which cannot accept all possible characters.

AFT is intended to be used as a replacement for the X.25 level two framing technique in cases where synchronous communication is not practical.

For more information on X.25/AFT contact:

Research Department
Hayes Microcomputer Products, Inc.
705 Westech Drive
Norcross, Georgia 30092

This implementation of AFT supports all features of revision two of the protocol. A method is provided to select which of the possible options are to be used. The implementation has three components:

1) Option Selection
2) Frame Transmission
3) Frame Reception

The interface to the user of AFT was chosen to allow use of the software in many different environments. As provided this software requires additional machine dependant software to provide a full AFT implementation. The transmit and receive routines have been implemented in such a way that they may be called either within interrupt service routines as characters are sent and received or they may be called from non-interrupt routines which fill or empty queues used by the software doing the hardware dependant portion of the I/O.

This implementation provides no actual routines to do I/O since this is highly machine dependant.

In this program the terms bytes and characters are used as synonyms for eight bit groups of data which are known as octets in X.25. This program assumes that the implementation of type 'char' is an eight bit value. Also

the type 'int' is assumed to be at least 16 bits in size.

An attempt has been made to only use those features of C which are common to nearly all implementations. This code was actually tested using Microsoft C version 4.0.

Some abbreviations used in this program are:

FCS	Frame Check Sequence
LEN	Length
OPT	Option
RX	Receive
SUB	Substituted
TX	Transmit

The following routines make up the interface to the AFT implementation. It is assumed that the user is familiar with the C language.

```
aft_options(ebdt, transparency_level, suffix_len,
            suffix, max_rx_len)
```

This routine selects the options to be used for AFT communication. It must be called at least once before any other AFT routines are used. It may be called again later to change the previously selected options. This should only be done at a time when no frames are being sent or received.

'ebdt' is a flag (0=false, non-zero=true) which determines whether the eight-bit data transparency option is to be used on transmit and receive. The EBDT option should only be used in cases where the communication path does not transfer the high order bit of characters transparently. This option must be selected identically on both the sending and receiving sides of the link. Use of this feature adds an extra 14% overhead to the communications.

'transparency_level' takes on one of three values. Zero indicates that basic transparency is to be used. This should be selected when the communication path allows transparent transmission of all 256 possible characters. One indicates that flow control transparency is to be used. This should be selected when the transmission of X-on and X-off characters would cause the receiver to perform flow control which would prevent them from appearing within frames. Two indicates that control-character transparency

'suffix_len' is the length of a string which will be

appended to each frame when it is sent. This feature is used to provide any extra characters which the receiving system may require to recognize the end of an input. Zero should be used when no frame suffix is to be added which is the most common case. The maximum suffix allowed is three characters.

'suffix' is a pointer to the actual character string in which the suffix is stored. This is only examined if the suffix length is non-zero. This string may contain up to three characters which may each be any value.

'max_rx_len' is the size of the buffer which will be used for receiving frames. This length is used by the receive frame routines to prevent storing data past the end of the buffer. Received frames which are too long will be discarded. The receive buffer provided must be at least two characters larger than the maximum expected frame size. This is required since buffer is used for temporary storage of the two character frame check sequence.

int aft_tx_start(length, buffer)

This is the routine used to do the setup for transmitting a frame. This routine returns a value of zero if a new frame cannot be started because a frame is already being sent, or a value of one if the request is accepted. In either case this routine returns immediately. The actual sending of the frame is done by aft_tx_char.

'length' is the length of the frame to be sent. The minimum valid frame length is two characters. The maximum is limited only by the restrictions of the C compiler used.

'buffer' is a pointer to the buffer holding the frame to be sent. This buffer should contain only the address, control, and information fields for the frame. The AFT routines will generate starting and closing flags, frame check sequence, and other characters required for transparency when the frame is sent. AFT will not modify the contents of the buffer. The buffer contents should not be modified by any other routines until transmission of the frame is completed or an incorrect frame may be sent.

int aft_tx_char()

This routine is used to obtain the next character to be sent in order to transmit a frame. It returns characters to be sent as a value from zero to 255 in the low order byte of the returned integer and zero in the high order byte of the integer. Once the final character of the frame has been sent the return value will be one in the high order byte and a flag character in the low order byte.

This routine is designed to be either used as a non-interrupt routine to which is called in a loop to fill an outgoing buffer which will be sent by other software or called within an interrupt routine when a transmitter buffer empty condition occurs to provide the next character to be sent. When used in an interrupt routine the caller may ignore the upper byte of the return value. If this is done then the result will be to send continuous flags between frames.

aft_tx_abort()

This routine may be called to cause aft_send_char to abort the frame it is currently sending. A lead-in character is sent followed by a flag to indicate that the receiver should ignore the frame. It a frame is not being sent then no action is taken.

int aft_tx_complete()

This routine is intended to be used in cases where aft_tx_char is being called during interrupt service. It provides a way for non-interrupt routines to poll for frame sending completion. It returns zero if a frame is currently being sent or one if no frame is being sent. A frame is considered to be sent once aft_tx_char is about to return the frame complete code (0x017E) to its caller. Instead of using this routine aft_tx_char may be easily modified to take any desired action when sending of a frame is completed.

int aft_rx_start(buffer)

This routine provides a buffer for the AFT software to use to receive a frame into. This routine returns a value of zero if the buffer is not accepted because a receive operation is already in progress or a value of one if the buffer is accepted. In either case this routine returns immediately to its caller.

'buffer' is a pointer to the buffer into which the frame will be received. This buffer will be filled one character at a time by aft_rx_char as characters for the frame are received. Once the receive operation is completed this buffer will hold the received frame address, control, and information fields. All flags, FCS, and extra transparency characters will have been removed.

int aft_rx_char(c)

This routine accepts a received character and adds it to the frame being received. If aft_rx_start has not been called to provide a buffer for receive then the first few characters of the frame will be saved in a temporary buffer. This will prevent loss of data in cases where aft_rx_char is being called directly by the receive interrupt service routine. This routine can also be called by a non-interrupt routine which obtains the characters from a received character queue. A value of zero is returned if this character does not complete a frame. A non-zero return value indicates that the character provided completed the received frame. In this case the value returned is the length of the frame which is contained in the receive buffer.

If an invalid FCS is received at the end of the frame then the frame will be discarded. A frame of less than two bytes will also be discarded.

'c' is the next character received from the communication port.

aft_rx_error()

This routine is called to indicate the occurrence of an error condition on the communication line. Possible conditions may be framing error, break received, parity error (if in EBDT mode), time out (which is not required for AFT), or overrun. When this routine is called AFT discards the frame currently being received and begins searching for the start of the next frame.

int aft_rx_complete()

This routine is used in cases where aft_rx_char is being called during interrupt service. It provides a way for non-interrupt routines to poll for completion of a receive operation. It returns zero if the receive operation has not completed and the received frame length if it has. After this routine returns that a frame has completed then aft_rx_start should be called as quickly as possible to provide a new receive buffer. If this is not done in time

then the next incoming frame may be lost. Instead of using this routine aft_rx_char may be easily modified to take any desired action when sending of a frame is completed.

OK Folks !

I have received several notes and messages about the
distribution of our software and documents via the net.
Let's understand a few basic points here:

ISSUE: I don'thave access to ftp to outside systems from hou2d.

If someone has such a package with source for a 3B1 and sends me a
DISK, I will get it going. I think I can get a network connection
at NJIT, but I will entertain other offers.

ISSUE: Hate mail for using the net for distribution.

The response has been as follows:
2 mailer generated messages signalling error.
2 human generated messages saying No Good.
6 human generated messages saying Thanks.

I wished every comment I make on the net could fair this well!
One interesting note: one of the messages that said "Don't do
it" came from an individual who doesn't like AFT and is
PUSHING SLIP...

I will re-examine the distribution mechanism and see what makes sense.
I will probably forward out the code through "comp.protocols.iso"
in the future. I will continue to send out documents and announcements
via several groups.

Comments?

Thanks,
            J. Gordon Beattie, Jr.

The Radio Amateur Telecommunications Society

206 North Vivyen Street

Bergenfield, New Jersey 07621

201-387-8896

The Radio Amateur Telecommunications Society (RATS) is proud to present

a forum at the 1988 Dayton Hamvention called:

ROSE: Open Systems Networking in the RATS Open Systems Environment

The talk will focus on the reality of Open Systems Networking in Amateur Radio. The Society has been involved in the development of mail/file/directory servers and networking software based on international communications standards.

Radio Amateurs who are telecommunications professionals or packet radio users will find this talk especially

interesting and enlightening, but the novice networker will have no trouble following the presentation.

* Software Distribution

Currently, the beta version of the ROSE X.25 Packet Switch and the release of the ROSErver/Packet Radio MailBox System are available. The Society will distribute the latest releases of its software at the session. Bring 5-1/4 or 3-1/2 inch diskettes for software and documentation. Remember RATS distributes its software for free! Come and get it!

* Where to Find RATS at Dayton

Members of RATS will be present in the PAC-COMM Packet Radio Systems booth (Booth 277/278). Members will be able to demonstrate and copy software for you to take home and use. Handouts describing our activities and frequencies of operation will be distributed at the packet forum on Friday afternoon from 1-5. We also are planning to be available for the Packet Get-Together at McNasty's on Saturday evening.

The RATS ROSE Forum

Time: 9:30 - 11:00

Place: ROOM 1 (check your programme to be sure)

The forum will consist of three three 30 minute talks. Each will explore an aspect of the Open Systems implemented by the Radio Amateur Telecommunications Society (RATS). Questions will be taken by each speaker.

Schedule

09:30 Review of Open Systems Networks and Protocols

- Presented by J. Gordon Beattie, Jr., N2DSY

This talk will provide an overview of a network based on Open Systems. The specific protocols and user services will be defined alone with the network management and planning dependencies found in a cooperative network.

10:00 The ROSE X.25 Packet Switch

- Presented by Thomas A. Moulton, W2VY

This talk will concentrate on the OSI Network Services

and how the ROSE X.25 Switch will support the users of "vanilla" AX.25, OSI Applications, TCP/IP and Net/ROM.

10:30 The ROSErver Mail, File and Directory Server

- Presented by Andrew R. Funk, KB7UV

This talk will concentrate on OSI Application Services and how the ROSErver/Packet Radio Mail Box System will provide these services to users and other systems.

Summary: KA9Q TCP/IP software available at Dayton

The KA9Q Internet Protocol Package will also be described and demonstrated at both the Trenton Computer Festival and at the Dayton Hamvention. This package is now estimated to be in the hands of at least several thousand people around the world, and it is enjoying rapidly increasing popularity on amateur packet radio. It presently supports the following proven, industry standard protocols:

Applications:

Telnet - remote login and "chatting"
FTP - File transfer (binary or text)
SMTP - Mail transfer

Transport/Session:

    TCP - Transmission Control Protocol
    UDP - User Datagram Protocol

Network:

    IP - Internet Protocol
    ICMP - Internet Control Message Protocol

Link/Subnet:

    ARP - Address Resolution Protocol
    Ethernet - 3Com 3C-501 interface driver
    AX.25 - packet radio (both connected and unconnected modes)
    SLIP - asynchronous point-to-point links

The primary machine supported is the IBM PC (and clones). Versions are also available for the Apple Macintosh, Commodore Amiga, and UNIX System V.

The entire package, which includes complete C source code and documentation, is copyrighted by myself and others, but it is completely FREE for noncommercial use. I encourage you to make copies for your friends back home; this minimizes the number of copies I have to make.

I will bring a limited supply of copies, but bring your own blank disks if you want to be sure of getting a copy. The package fits on one high-density 1.2 meg 5.25" floppy, two 720K 3.5" floppies, or three 360K 5.25" floppies. I should be able to handle all three formats at both Trenton and Dayton.

For those of you with Internet access, you may obtain the package by anonymous FTP from louie.udel.edu (10.0.0.96) under /pub/ka9q.

I'll give Phil a few copies of my Turbo C porting kit on 5 1/4 360 K
disks.

The porting kit is updated to version 871225.18, and is on clutx.clarkson.edu
[128.153.4.3] in pub/Ka9q/kit.arc via anonymous ftp.

Subject: Red Ryder 10.3 Lock-Up Problem

I was running into big time problems with Red Ryder and could not figure out what I was doing wrong. I will explain my set up, the problem and the FIX. I hope this simple Fix helps someone else avoid the same problem.

My Set Up:

- Mac Plus (standard with 1 Meg)
- Data Frame 30 Hard Drive
- Magic Modem 1200 or PK-232
- Red Ryder Version 10.3

The Problem:

After establishing a connect with a BBS, things seem to be working okay then for some unknown reason the text would start scrolling up the screen and the cursor would turn to the vertical I-Beam and lock-up Red Ryder. I had no control over anything and had to use the reset button on the Mac to escape.

I tried just about everything I can think of to stop this lock up. My suspicion was it had something to do when the other party would send a tab.

The Fix:

I discussed the problem with the SysOp of the Austin Bull Creek BBS and he suggested I check the Tab Stops setting under the RR Local Menu. I checked and it showed no tabs set. I followed his advise and click one tab setting at

position five. This simple fix solved the problem.

The Tip:

Always have at lease one Tab Stop set! This caution should be added to page

11 of the Red Ryder Documentation. Running without a Tab Stop will cause

Red to do weird things.

Can anybody email me more details about SLIP (Serial Link Internet
Protocol)? I am interested in the possibility of supporting multiple
telnet type login sessions on one physical radio channel, using a
standard, albeit high speed (38.4Kb?) serial line between TNC and
computer.

Does KA9Q do this? Are other possible sources PD? I need to have
source code available. I (read: my employer) would be interested in
discussing commercial licensing at some future point. For now,
though, folks, I'd just like to know what I'm talking about.

Can you help?

Email ONLY, please. The .sig path should work just fine.

Tnx,

I don't think I've seen a formal description of SLIP, but it is very
simple. It is just a framing technique suitable for carrying IP
datagrams (or whatever you want) on asynchronous links.

Four special characters are defined. They are as follows:

<Frame End>   C0 hex
<Frame Esc>   DB
<Transposed Frame End> DC
<Transposed Frame Esc> DD

Transmitter Operation

The transmitter sends the frame a byte at a time, ending it with the
<Frame End> character. If a <Frame End> character occurs in the body of
the frame, it is replaced by the two character sequence <Frame Esc>,
<Transposed Frame End>. Similarly, if a <Frame Esc> character occurs in
the body of the frame, it is replaced by the two byte sequence <Frame
Esc>, <Transposed Frame Esc>.

Receiver Operation

The receiver appends incoming bytes to a reassembly buffer, passing whatever has been accumulated up to the next layer when it sees a <Frame End> character. (The <Frame End> itself is not added to the buffer). The receiver maintains a one-bit "escaped" flag that is set whenever it sees a <Frame Esc> character. (The <Frame Esc> character itself is NOT added to the reassembly buffer). If the receiver then sees either a <Transposed Frame End> or a <Transposed Frame Esc> while in "escaped" mode, it is translated to a <Frame End> or a <Frame Esc>, respectively, and adds it to the reassembly buffer. Regardless of the character received while in escaped mode, the "escaped" flag is cleared. If the <Transposed Frame End> or <Transposed Frame Esc> characters are received while NOT in "escaped" mode, no special action is necessary; they are added to the reassembly buffer unchanged.

Note that the <Frame End> character is *never* sent over the line except as an actual end-of-frame indication.

The original SLIP put <Frame End> characters only at the end of each frame. I.e., a series of back-to-back frames would be separated by only a single <Frame End>. I have made a minor, backward compatible change to the protocol that puts a <Frame End> in front of each frame as well. This adds a very small bit of overhead (back-to-back frames are now separated by two <Frame End> characters) but it improves performance over noisy links by forcing the receiver into a known state at the beginning of each new frame.

When used to send IP datagrams over phone lines, the datagrams are encapsulated directly in frames formatted as described here; no additional header is carried. There has been considerable discussion about the need for such a header, but nothing has actually come into use, as far as I know.

I use SLIP in a different way between a system running my TCP/IP software and a KISS TNC. There I use SLIP style framing to carry AX.25 frames and control messages between the TNC and host, and there is a one-byte "type" field at the beginning of each frame. For details, see the paper by K3MC and myself in last year's ARRL Computer Networking Conference proceedings. (The same article also described SLIP in detail).

Lately there have been a number of requests for a description of
the SLIP encapsulation scheme for sending IP packets over serial
links. SRI has (finally :-) issued an RFC describing how this is
currently implemented. It's only six pages long, so I've attached
a copy. Apologies if you've already seen this.

(cut the .signature at the end)

A NONSTANDARD FOR TRANSMISSION OF IP DATAGRAMS OVER SERIAL LINES: SLIP

INTRODUCTION

The TCP/IP protocol family runs over a variety of network media: IEEE 802.3 (ethernet) and 802.5 (token ring) LAN's, X.25 lines, satellite links, and serial lines. There are standard encapsulations for IP packets defined for many of these networks, but there is no standard for serial lines. SLIP, Serial Line IP, is a currently a de facto standard, commonly used for point-to-point serial connections running TCP/IP. It is not an Internet standard. Distribution of this memo is unlimited.

HISTORY

SLIP has its origins in the 3COM UNET TCP/IP implementation from the early 1980's. It is merely a packet framing protocol: SLIP defines a sequence of characters that frame IP packets on a serial line, and nothing more. It provides no addressing, packet type identification, error detection/correction or compression mechanisms. Because the protocol does so little, though, it is usually very easy to implement.

Around 1984, Rick Adams implemented SLIP for 4.2 Berkeley Unix and Sun Microsystems workstations and released it to the world. It quickly caught on as an easy reliable way to connect TCP/IP hosts and routers with serial lines.

SLIP is commonly used on dedicated serial links and sometimes for dialup purposes, and is usually used with line speeds between 1200bps and 19.2Kbps. It is useful for allowing mixes of hosts and routers to communicate with one another (host-host, host-router and router-router are all common SLIP network configurations).

AVAILABILITY

SLIP is available for most Berkeley UNIX-based systems. It is included in the standard 4.3BSD release from Berkeley. SLIP is available for Ultrix, Sun UNIX and most other Berkeley-derived UNIX systems. Some terminal concentrators and IBM PC implementations also support it.

SLIP for Berkeley UNIX is available via anonymous FTP from uunet.uu.net in pub/sl.shar.Z. Be sure to transfer the file in binary mode and then run it through the UNIX uncompress program. Take

the resulting file and use it as a shell script for the UNIX /bin/sh (for instance, /bin/sh sl.shar).

PROTOCOL

The SLIP protocol defines two special characters: END and ESC. END is octal 300 (decimal 192) and ESC is octal 333 (decimal 219) not to be confused with the ASCII ESCape character; for the purposes of this discussion, ESC will indicate the SLIP ESC character. To send a packet, a SLIP host simply starts sending the data in the packet. If a data byte is the same code as END character, a two byte sequence of ESC and octal 334 (decimal 220) is sent instead. If it the same as an ESC character, an two byte sequence of ESC and octal 335 (decimal 221) is sent instead. When the last byte in the packet has been sent, an END character is then transmitted.

Phil Karn suggests a simple change to the algorithm, which is to begin as well as end packets with an END character. This will flush any erroneous bytes which have been caused by line noise. In the normal case, the receiver will simply see two back-to-back END characters, which will generate a bad IP packet. If the SLIP implementation does not throw away the zero-length IP packet, the IP implementation certainly will. If there was line noise, the data received due to it will be discarded without affecting the following packet.

Because there is no 'standard' SLIP specification, there is no real

defined maximum packet size for SLIP. It is probably best to accept the maximum packet size used by the Berkeley UNIX SLIP drivers: 1006 bytes including the IP and transport protocol headers (not including the framing characters). Therefore any new SLIP implementations should be prepared to accept 1006 byte datagrams and should not send more than 1006 bytes in a datagram.

DEFICIENCIES

There are several features that many users would like SLIP to provide which it doesn't. In all fairness, SLIP is just a very simple protocol designed quite a long time ago when these problems were not really important issues. The following are commonly perceived shortcomings in the existing SLIP protocol:

- addressing:

  both computers in a SLIP link need to know each other's IP addresses for routing purposes. Also, when using SLIP for hosts to dial-up a router, the addressing scheme may be quite dynamic and the router may need to inform the dialing host of

  the host's IP address. SLIP currently provides no mechanism for hosts to communicate addressing information over a SLIP connection.

- type identification:

  SLIP has no type field. Thus, only one protocol can be run over a SLIP connection, so in a configuration of two DEC computers running both TCP/IP and DECnet, there is no hope of having TCP/IP and DECnet share one serial line between them while using SLIP. While SLIP is "Serial Line IP", if a serial line connects two multi-protocol computers, those computers should be able to use more than one protocol over the line.

- error detection/correction:

  noisy phone lines will corrupt packets in transit. Because the line speed is probably quite low (likely 2400 baud), retransmitting a packet is very expensive. Error detection is not absolutely necessary at the SLIP level because any IP application should detect damaged packets (IP header and UDP and TCP checksums should suffice), although some common applications like NFS usually ignore the checksum and depend on

the network media to detect damaged packets. Because it takes so long to retransmit a packet which was corrupted by line noise, it would be efficient if SLIP could provide some sort of simple error correction mechanism of its own.

- compression:

  because dial-in lines are so slow (usually 2400bps), packet compression would cause large improvements in packet throughput. Usually, streams of packets in a single TCP connection have few changed fields in the IP and TCP headers, so a simple compression algorithms might just send the changed parts of the headers instead of the complete headers.

Some work is being done by various groups to design and implement a successor to SLIP which will address some or all of these problems.

SLIP DRIVERS

The following C language functions send and receive SLIP packets. They depend on two functions, send_char() and recv_char(), which send and receive a single character over the serial line.

```
/* SLIP special character codes
 */
#define END             0300    /* indicates end of packet */
#define ESC             0333    /* indicates byte stuffing */
#define ESC_END         0334    /* ESC ESC_END means END data byte */
#define ESC_ESC         0335    /* ESC ESC_ESC means ESC data byte */

/* SEND_PACKET: sends a packet of length "len", starting at
 * location "p".
 */
void send_packet(p, len)
        char *p;
        int len; {
```

```
     /* send an initial END character to flush out any data that may
      * have accumulated in the receiver due to line noise
      */
        send_char(END);

     /* for each byte in the packet, send the appropriate character
      * sequence
      */
          while(len--) {
                  switch(*p) {
                  /* if it's the same code as an END character, we send a
                   * special two character code so as not to make the
                   * receiver think we sent an END
                   */
                  case END:
                          send_char(ESC);
                          send_char(ESC_END);
                          break;

                  /* if it's the same code as an ESC character,
                   * we send a special two character code so as not
                   * to make the receiver think we sent an ESC
                   */
                  case ESC:
                          send_char(ESC);
                          send_char(ESC_ESC);
                          break;
```

```
                  /* otherwise, we just send the character
                   */
                  default:
                          send_char(*p);
                          }

                  p++;
                  }

          /* tell the receiver that we're done sending the packet
           */
          send_char(END);
          }

   /* RECV_PACKET: receives a packet into the buffer located at "p".
```

```
 *      If more than len bytes are received, the packet will
 *      be truncated.
 *      Returns the number of bytes stored in the buffer.
 */
int recv_packet(p, len)
        char *p;
        int len; {
        char c;
        int received = 0;

        /* sit in a loop reading bytes until we put together
         * a whole packet.
         * Make sure not to copy them into the packet if we
         * run out of room.
         */
        while(1) {
                /* get a character to process
                 */
                c = recv_char();

                /* handle bytestuffing if necessary
                 */
                switch(c) {

                /* if it's an END character then we're done with
                 * the packet
                 */
                case END:
                        /* a minor optimization: if there is no
                         * data in the packet, ignore it. This is
                         * meant to avoid bothering IP with all
                         * the empty packets generated by the

I believe that someone has ported the W0RLI or other BBS code to the amiga
and would like to get a copy (source included) if it is available.
How do I get a copy?

Please mail reply to ihnp4!watmath!alberta!damask!hardie fairly soon
as this machine self-destructs in about two weeks!

Lines: 29

This one's for you

  Does anyone have a copy of the KA9Q sources that will compile properly
on the AMIGA using MANX 3.6 .

  My version (871225.15) will not compile properly since MANX appears not
to understand constructs of - #if defined(AMIGA) || defined(UNIX). This
I can work around but it also is missing at least two files dir.c and dir.h.
In addition the makefile is not properly configured and attempts to link
the *dump files multiple times. This to can be fixed but it makes me wonder
if it ever worked properly on the AMIGA.

  I have some modifications (improvements? :-)) I would like to make.

Primarily I want to force an AX25 connection to send all received data
to the mailer. Most of my friends not running TCP are in the habit of
connecting - leaving a short message - and disconnecting. The only reason
I am not running the TCP software is that with the current code the message
is thrown away if I'm not present to read it as it comes in. The other
modifications are specific to my situation (1 tnc, 1 radio, two hams - make
it recognize two callsigns, add a CTEXT message to satisfy the AX25 users).

  At one time I had the executable of a version that ran on the AMIGA, but
lost it in a hard disk crash. So I know that it is running on the AMIGA, I
just need some help getting the latest version that will compile.

Any and All help will be greatly appreciated.

Please respond via EMAIL

   A while back, I added an AX.25 personal mailbox. It gives the user
a signon message and menu, and allows him (or her) to enter SMTP
mail, page the owner for chat, or disconnect. The code is a bit crude,

but does the job. You can find it among the net/rom code in nrbdale.arc
on louie.
   Phil now tells me he intends to merge this stuff in some time soon.

I am looking for a source of RFCs. My company has a limited store of
them, but some of the less used ones, like EGP GGP etc. are not in it.
I don't have Internet access so cannot ftp them; can someone indicate
their willingness to mail me a couple, preferably from a UK or EU site
to save mail costs. If you can help, can you email me with an index
please.

The info-server at SRI-NIC allows anyone to pick up RFC's by email. You
don't need to have Internet access (or speak FTP). Here's the details:

    NIC Mail Services   November 1987

       This is an automated service provided by the DDN Network Information
    Center. It allows access to NIC documents and information via ordinary
    electronic mail. This is especially useful for people who do not have
    access to the NIC via a direct Internet link, such as BITNET, CSNET
    and UUCP sites.

       To use the mail service, send a mail message to SERVICE@SRI-NIC.ARPA.
    In the SUBJECT field, request the type of service you wish followed by
    any needed arguments. The message body is normally ignored. Large files
    will be broken into smaller separate messages. The information you
    request will be sent back to you as soon as possible.

    The following services are currently available:

    HELP   This message; a list of current services.
    RFC nnn   nnn is the RFC number or the word INDEX.
    IEN nnn   nnn is the IEN number or the word INDEX.
    NETINFO xxx   xxx is a file name or the word INDEX.
    SEND xxx xxx is a fully specified file name.
    HOST xxx Returns information about host xxx.
    WHOIS xxx Returns information about xxx from the WHOIS service.
                   Use "WHOIS HELP" for information on how to use WHOIS.

    Example SUBJECT lines:
    HELP
    RFC 822
    RFC INDEX
    NETINFO DOMAIN-TEMPLATE.TXT
    SEND RFC:ASSIGNED-NUMBERS.TXT
    HOST SRI-NIC.ARPA
    WHOIS LOTTOR, MARK

    Send comments or suggestions to SUGGESTIONS@SRI-NIC.ARPA.

    Send questions and bug reports to NIC@SRI-NIC.ARPA.

For people in the UK, UCL keep most of the RFC's on-line and they are
readily available. They can be accessed by anonymous NIFTP and I think
there's also an info-server that will allow you to pick RFC's up by
email. Sadly, I can't put my hands on the file that had all the details
of how to fetch RFCs from UCL.

          Jim

    Just a quick reminder.... The New England Division Arrl Convention
will take place this weekend Oct 1 and 2 at the Sheraton Motel, Boxboro
Mass. Flea Market for sellers opens at 7:00 Am Sat.
Along with the usual tech talks and forums, there will be 3 Hidden TX
hunts, 2 sat and 1 sun, FCC exams (some walk-ins accepted), Woof Hong
ceremony (sat at Midnight), and many vendors with new equipment. There will
be many prizes given away Sunday at 2:00 P.M. Lots of other things happening
also.

    ALSO SAT OCT 8 is the Fall edition of the Hoss Traders Flea
market. It will be at the KINGSTON Fair Grounds Kingston N.H. Doors open
at 4:00 pm Fri for campers and selling. The sat edition starts at DAWN !
C U there !!!.....73

My brother (KA1PPG (Needham MA. without usenet access) wants to
get into packet radio. I've let him borrow an old computer of
mine (Trash-80) (TSR-80 Model I). It has a half decent comm
programs thats been tested via a hookup with my IBM.

Does he need anything else besides a TNC?

The TNC we were looking at had connections on the back for the
computer (RS232) and a DIN connector for the radio.

please email replies to grossman@bbn.com

cintosh Packet Radio Net   - MACNET -

If you're into RADIO and MACINTOSH computers, send us a packet and join
our most informal (but potentially most informative) Mac Packet Radio Net.
We share questions, answers, concerns, news, comments, and commradery via
packet radio to enable all of us to learn more and have more fun!

To enter MACNET: first send us your LOG IN packet.
The ADDRESS is KB1HE @ WB1DSW (Net Control)

The SUBJECT or TITLE of your message should be MACNET
And your first MACNET packet should contain your:
NAME:
CALL:
QTH:
HOME PBBS: (Where you'll receive each MACNET packet)
MAC MODELS USED:
TNC/DATA CONTROLLER:
PROGRAMS USED FOR RADIO:
RADIO MODELS USED:
MAC INTERESTS:
RADIO INTERESTS:
HINTS'N KINKS: (TIPS, QUESTIONS and ANSWERS)
OTHER MAC CONNECTIONS/INTERFACES: (BCS, COMPUSERVE, ETC)
ADDITIONAL COMMENTS/QUESTIONS FOR MACNET MEMBERS:

Your LOG IN and all future packets to MACNET NET CONTROL will be repeated
to each MACNET member automatically. Share your thoughts with MACNET and
make MACNET transmissions anytime.

Present members include: K1BT @ KQ1K - Tom, WB8EHS @ WB1DSW - Daniel,
N1FMK @ K1UGM - Dan, VE2ESM @ VE2CSC - Jacques, WA2BSR @ K1UGM - Spencer,

Recently a list of toll free (1-800) BBS telephone numbers was published in Computer Shopper Magazine. These numbers were at one time BBS numbers but they are outdated and many have been reassigned to different customers by the telephone company. Computer Shopper printed a retraction notice in the Decmber issue on page 655 saying not to call ANY of the published numbers and the standard disclaimer that goes along with it. If anyone out there has a list that they might have been obtained from that information PLEASE STOP CALLING the numbers. Some of the Businesses mentioned in the original article were as follows:

Abacus Associates

Access Unlimited Applied Microsystems Calsoft CompuAdd

Compaq CompuSoft Computer Mail Order DEC Epson

Hayden Software Lyco Computer Leading Edge MicroTek

Okidata Sams Books

Hopefully this will be enough information for you to ascertain if you indeed have the list that was published.

    The HOSSTRADERS Ham Radio and Electronics flea market is RETURNING
to the DEERFIELD Fairgrounds, Deerfield, NH. New Date is JUNE 3, 1989.
    Start planning now to attend the largest Ham Radio flea market
in New England. Remember, the BEST deals always go down the night before!
                                                              73

To date I have seen a couple of follow-ups to the above, one indicated
that that is part of ham-radio, another indicated that packet had a
a new group created for it to move that traffic out of general ham-radio
discussions.

I would tend to agree with the idea that the ongoing discussions in
rec.ham-radio on a no-code/yes-code license and of other proposals for
changing the Amateur Radio Licence structure are of such volume that
those discussions might be moved into a dedicated group for those who
are interested to present their viewpoints without filling up rec.ham-radio.

CALL FOR DISCUSSION:

In line with accepted net practices, I would like to call for discussion
the formation of:

            rec.ham-radio.licensing

Discussion might also indicate other possable names and/or guidelines

for such a group.

Althought this is posted to both rec.ham-radio and news.groups, the proper
place for this discussion is (I understand) news.groups.

For readers of the INFO-HAMS mailing list, I will also monitor that for
any discussion which you are unable to post to news.groups and summarize
and re-post that summery to news.groups prior to any call for votes.

Communications Research Centre has developed a pre-processor package for the HF Ionospheric Communications Analysis and Prediction program (IONCAP for IBM-pc). The data entry program is called Ionhelp and runs on IBM-pc type computers.

Ionhelp generates output data in the format required by Ioncap program. The built-in context sensitive help information, pre-programmed selection menus simplifies data preparation. The data validation for the data entered reduces operator errors.

The Ionhelp program and user's manual is available to the interested organizations free of charge. To obtain a copy, send an official letter requesting Ionhelp with a formatted floppy to my address. This package does not include Ioncap program.

Department of Communications makes no warranties as to the contents of the Ionhelp manual, Ionhelp software package and specifically disclaims any implied warranties of merchantability or fitness for any particular purpose. Also further reserves the right to make changes to the specifications of the program and the contents of the manual without obligation to notify any person or organization of such changes.

Department of Communications makes no warranties on the results of the Ioncap program and has no relationship to the originators and suppliers of Ioncap package. Ioncap program and the user's manual is property of the United States Government.

Today. It was only a reminder program. I ported Xenix/V7 MicroEmacs to
System V last week. Took about an hour, I'd guess. And this is at a
Fortran shop.

So some form of coercion was used to force people to learn and use this
reminder program? I suspect the person asking the question meant "When was the
last time you installed, say, a new version of an *existing* program that
forced the users of that program to learn a new command or commands?"

>
> What I wanted to do was send computer data through the airwaves. Funny,
> a bunch of people wanted to stop me. I wasn't planning to interfere with
> anybody, but for some reason they wanted me to learn morse code and apply
> to the government for "permission".

From your comments, I suspect strongly that you wanted to provide an unlimited bridge between computer networks and the packet network. There are real problems with that approach, and amateur radio is not the appropriate place to set up a common carrier.

Learning the code and applying to the government for a ticket are responsibilities that go along with the privilege of reasonably unfettered access to the radio spectrum. There's exactly one radio service that requires no license of any kind to operate. Have you listened on 27 megahertz lately?

> We are just coming from opposite points of view; you obviously can't see
> how the requirement for a ham ticket is a limitation on innovation. Just
> like a curb is no problem for somebody in a wheelchair; if they really
> want to get up that curb, they sure can.

This analogy is fatally flawed: it's not like a curb for someone in a wheelchair, but it's the wheelchair itself for a paraplegic. Without the ticket, you can't legally get on and experiment, just like a paraplegic can't get around (easily) without a wheelchair.

The requirement for a license is written in the Communications Act of 1934. If you dislike it that much, write your Congressmen - but don't expect to get very far.

> > There IS a problem with letting the world flow data on an amateur link:

Are you out to put GTE out of business? Good luck....the FCC won't sit still

for that.

> You mention another problem with ham radio as a means for computer data
> sharing -- its "non-commercial" orientation. I got the impression that if
> I logged into my employer's machine and did some work via packet radio,
> some of the "mickey mouse" rulewatchers would "try to stop me" again.
> What good is it to build a network if you can't use it for any real work?

Because ham radio is a hobby. Pure and simple. That has been built into the very bedrock of the service, from its earliest origins. Using the packet network to log on to your employer's machine puts the packet network in direct competition with the common carriers, and that's illegal and unfair competition.

> >) [They claim to be practicing for providing emergency communications

> company does, or the military phone systems do. The cellular phone systems
> also have provisions like this.

Public radio networks, no matter how well designed, will fill to unusability during a disaster...or, again, have you listened to 27 megahertz? The public using the airwaves leads inevitably to anarchy and uselessness in times of stress. The phone company doesn't do all that well a job in preparing for heavy network loading during a disaster; have you tried to call into, or even out of, a disaster area? I have. It's no picnic - in fact, most of the time it's downright impossible.

This is a nice, motherhood-and-apple-pie argument - but it simply will not work.

> > The proposal was very badly thought out. It would have given wide-ranging

> have the equipment to verify correct operation anyway, e.g. spectrum
> analyzers.

I don't know about the hams in Southern California, but I'll pick any ham club in the Houston area, and let you run that test. You'd lose big. By far and away most hams I know take great pride in emitting a clean signal and following the rules.

> > The Morse Code objection is a red herring. Anyone can, with a minimal amount

> > aren't intelligent enough to do so?
>
> I've heard this one before, it's not my experience, and I reject the
> implication that anyone who doesn't want to waste their time on Morse
> is unintelligent.

I wasn't trying to imply that they were. I was asking if you were implying they weren't. I repeat my earlier contention: ANYONE can learn the code. All it takes is a minimal amount of time and work.

Your whole argument is that anyone should be able to get a ham license, thereby earning the privilege of access to some of the choicest spectrum available, without having to work for it. Then they should be able to use these new privileges to bypass the telephone and other common carrier networks and do whatever they wish.

Why? Why should a network of volunteer ham radio operators try to compete with commercial interests? Worse, why should hams allow these commercial interests to take over our spectrum, with all the impact on the public interest that that entails? Hams have a long and shining history of public service. Does GTE Telenet? Would they suddenly get the desire to unselfishly serve the public by going out and passing a written test only?

I suggest instead that allowing commercial use of amateur spectrum would result in the death of any public service that the amateur service provides. That service is the ONLY reason we still have the wide range of frequencies that we do. That is what is remembered by the delegates to the World Administrative Radio Conferences. Commercial interests have no reason to unselfishly pursue the public welfare. Amateurs do.

I take more pride in the fact that I use my radio expertise to advance the public welfare than in the fact that I hold an Extra class license. The look on a motorist's face as I stand there and call an ambulance with my handheld is worth all the work I had to do to get there. Public service is highly rewarding - but not in the only way that interests a commercial entity: money. Therefore, why should they do it?

(Apologies to comp.dcom.modems readers; I haven't seen John respond to any of the comments on this subject posted on rec.ham-radio.packet, so I crossposted to make sure John could read it and respond. Replies have been directed to rec.ham-radio.packet [I think].)

Summary: The basic problem seems to be morse.

I, too, don't see the point to the morse requirement. It's a game. Having to
pass some sort of test is one thing, but having to learn a useless skill
through boring rote repetition is another. Make the test as tough as you
like... but test something useful.

Peter is certainly smart enough to have guessed, even though I admit it
was not explicit, that my comment referred ONLY to those situations
where the users had no alternative but to learn something new. Emacs,
though readily available, is usually not the only editor in a shop.

While I am certainly one of the people who learned the morse and forgot it, I am happy that the requirement is there. It is probably the one thing that keeps HAM radio from becoming like CB. To make the written test too difficult would only prove to make HAM radio an elitest hobby; only within reach of the technically endowed.

KEEP HAM RADIO FROM BECOMING LIKE CB -- KEEP MORSE!

It's just not that tough to learn 5 words per minute. If you really want a HAM liscense then take the 1/2 hour a noght for two weeks and learn it !

I will just add a little fuel to the fire on this debate, the Zmodem protocol, heavily advertized in Chuck Forsburg's (sp?) signature, work *very well* over packet connections, having been designed for just that. In addition the low volume of reverse channel makes it suitable for use with half duplex connections. Typical performance is 95+% of theoretical max, for example 231-233 cps on 2400 baud async half duplex connects (actual measured on a number of 100k+ file transfers).

I'm told that SEAlink and megalink provide the same range of performance, but I see little reason to use them other than compatibility and on very small machines which benefit from the low
~~~~~~

overhead of megalink.

I have no idea why the performance of ham packet radio is so poor, nor why various people on this group have claimed that the use of more than one (or at most two) repeaters resulted in unacceptable throughput. Unless there is a legal reason why this protocol may not be used, I would like to invite one of the interested parties to test it. Source to several versions of the drivers for the protocol have been posted, I will supply them on request.

Yes, I realize that there will still be a problem with very small messages, don't waste bandwidth mentioning it.

   I'll have to agree with the points that Bob McGwier makes. If John wants to orginize or experiment with some sort of packet radio link, he can apply for a Special Temporary Authorization (STA) from the FCC. The Big Boys do it all the time (eg. California Microwave, Ampex, Motorola, etc.) STAs can be taylored to allow some pretty sloppy modulation too, so you can find some sort of old commercial gear to use with it.
   John, you are asking to use a NON-commercial meadium to handle commercial traffic. How would you feel if a commercail user of the net started to do message bombing runs on the net

through your board. I keep hearing about the "non-commercal"
flavor to UUCP (something that will have to change in the near
future, by the way). Using the net commercially would be like
using ham freqs commercially. There are frequencies set aside
for what you want to do (eg 23GHz). Building equipment for
those freqs isn't that difficult or expensive.
   If you are interested in applying, you should contact the
local field office of the FCC at (415) 556-7701, and ask for the
STA forms. I'm not sure what the form numbers are, but if you
ask for one of the officers<?> s/he should be able to guide you
in the right direction. The last time I needed something like
this I tald to a woman named "Amy". Sorry, I don't remember her
last name.

I wholeheartly agree with the bannig of the morse test, at
least for something lower like the "Tech" class. Morse does
have it's place, but it is turning away many potential licencse
canidates.

I am not a ham ... I want to be a ham, but that code requirement
stops me. On the other hand I can see good reason why the code
requirement is there ....

If you're in some real-true-blue emergency situation and you have
to construct a radio just to be able to communicate, then you're
more likely to be able to construct one which can do code than
one which can do voice. It's not useless.

ip:1048

Announcing an update to the KA9Q TCP/IP software package release of 870526.0,
bringing the current release date up to 870829.0. This update adds fixes bugs,
and adds some minor functionality. A new release will occur in a couple of
weeks with support for 4bsd and sysV unix machines, this version still supports
only the PC and PC clone class of machines.

The changes:
     - Improved KISS bits for the TNC1 from Gerard, PA0GRI.

     - the ASCII text at the top of one of the TNC2 hex files is gone now.

     - Minor tweaks to BM from Gerard, PA0GRI, Phil KA9Q, and yours truly.
       Biggest noticeable differences are that BM no longer looks at the
       hosts.net file at all, but instead passes symbolic hostnames to
       the smtp client in net... and we once again changed the text entry
       code. It's more like bsd Mail now. Default is a silly text entry

routine, a "~e" gets you into your favorite editor, and a "~p" shows what you've typed so far.

- NET.EXE understanding of symbolic hostnames ala the hosts.net file has been extended. You now need to wrap numeric IP addresses in square brackets, as in "[44.32.0.16]", as you can use symbolic names anywhere you need to use an IP address (including in the autoexec.net file!)

- Since BM no longer deals with IP addresses, a "gateway" command has been added to NET.EXE, so that it knows where to send mail that fails the lookup in hosts.net.

- Internal changes and a fix to the ftp server so that it now handles NLST command properly, all from Phil, KA9Q. Bugs that were in the 870526.5 interim release that was only distributed in a limited fashion apparently disappeared with the latest tweaks...

- documentation has (as usual) been updated somewhat.

- some other random tweaks I'm sure I've forgotten...

What to do once you have software, aka "getting an IP address":

Users of this software package become part of the "global IP internet", and as such need to obtain unique IP address assignments for each host they plan to put on the air, or "on the wire". Major metropolitan areas in the US, and countries with active TCP-using groups probably already have blocks of addresses in amateur radio 44.X.X.X block assigned to them. Ask around locally before you go any further.

If there is no local address block in your area, and/or noone is coordinating address assignments for your local net, contact Wally Linstruth WA6JPR. Wally is the global top-level address administrator for the ham radio 44.X.X.X subnet. Wally may be reached by email at

wally%net1.ucsd.edu@sdcsvax.ucsd.edu
or wally@net1.ucsd.edu
or ...!sdcsvax!net1!wally

or via the new forwarding mechanism I have set up for those sites who know how to reply via mail to this message, but can't reach Wally's machine directly:

winfree!wally -or- wally@winfree.uucp
or wally%winfree.uucp@flash.bellcore.com

How to obtain the KA9Q Internet software:

- Via uucp, the files are on winfree in tar archives as:

/usr/spool/uucppublic/pub/ka9q_all.tar.Z 16 bit Compress 4.0

/usr/spool/uucppublic/pub/ka9q_all.t12.Z 12 bit Compress 4.0

For Anonymous UUCP login, use phone number 303/593-0696, at 2400 baud (it will do 1200 if you send a return to rotate it down), "standard Unix login sequence", username of "Uanon", password of "notFTP". An example L.sys entry ala winfree's uucp would be:

winfree Any ACU 2400 13035930696 ogin: Uanon word: notFTP

I've never run an anonymous login for uucp before, so let me know if I got it wrong!

A reasonable command to issue to pick up the 12-bit distribution would be

uucp winfree!~/pub/ka9q_all.t12.Z /usr/spool/uucppublic

- ***** My BBS is currently down with a dead hard drive. If anyone ***** has a spare drive they would be willing to donate to the cause, ***** *please* get in touch with me ASAP! Cashflow around here is ***** a joke... :-(Normally,

Via Opus, log in to my BBS and download from the appropriate files area. There are several .ARC files for the full distribution, one for each of the directories. SeaDog file requests are ok.

I have configured my BBS to allow first time users ample resources to download the full distribtuion at 1200 baud. The phone number is 303/593-0766.

If you have any trouble downloading from the BBS, please let me know. Speeds that are supported include 300, 1200, and 2400.

- Via US Snail, Andy Freeborn N0CCZ has agreed to make floppy copies. To get a copy from him, send $5 AND a completed return address mailing label (orders without a mailing label will be considered contributions to the BBS hard drive fund, see above... :-) to:

Andy Freeborn, N0CCZ
5222 Borrego Drive
Colorado Springs, CO 80918
USA

What you get for the $5: 5 floppies, including two of RFC's and IEN's that relate to the code, two that include the actual release, and one that is intended to be a sort of "plug and play" disk for getting on the air immediately...

For those who just want the RFC/IEN disks, Andy will send you just those two disks for $2 and a mailing label. If you want any particular RFC or IEN, contact Andy to find out what archive it is in (we have them all packed up, one ARC per 360k pc disk), and he will send you

that RFC or IEN, along with many others, on a floppy for $1/disk. You can't mix and match, you get the block of documents that are in a given archive.

DO NOT SEND floppies, mailers, postage, etc... but DO send the mailing label!

Andy is also reachable as
winfree!andy or andy%winfree.uucp@bellcore.com
if you need more information (?). Andy is within an on-air FTP of me, so we should be able to keep his bits up to date!

- on the ARPAnet, or attached portions of the Internet, look on
louie.udel.edu
via anonymous FTP for the files in the directory
pub/ka9q

- Within a day or two of a new release, the code should also be available from the following additional secondary distribution points:

from Doug KD4NC in Atlanta, GA
uucp: winfree!kd4nc!dug
from Bob Hoffman N3CVL in Pittsburgh, PA
arpa: rbh@cadre.dsl.pittsburgh.edu
uucp: pitt!hoffman
from Wally Linstrugh WA6JPR in Santa Barbara, CA
arpa: wally@net1.ucsd.edu
from Brian Kantor at UCSD. (via anonymous FTP?)
arpa: tcp-group-request@sdcsvax.ucsd.edu
uucp: sdcsvax!tcp-group-request

Unreleased (read: under development) versions are often available on louie.udel.edu, generally alongside official releases...
caveat emptor...

If anyone has any trouble getting hold of a copy of the code, please let me know!

How to contact me:

Lyndon you sure are getting abused.

So we have to go back to the good old days of thirty years ago it see.
Isn't it interesting how the window of "the good old days" keeps moving
forward. I first started reading ham mags when I was twelve (that was
1963 - close enough) and you know what??? They complained that hams were
old farts who bought appliances and didn't build any more ... let alone design
new modes. Silly Sideband was nicely established but a lot AM's were still
hoping to stamp it out. I have seen references to the replacement of spark
with CW which suggested that a lot of reactionaries were UPSET.

Wayne Greene (my favourite right winger bar none!) thinks the world has
gone to pot but in reality not much has changed since the first stone age
warrier refused to use a bronze axe head.

Just before everyone runs out to download this from ncc...

I will *not* be bringing down 870829.0. Instead I am waiting for the
next release with the UNIX support as this is the environment I'm
building "APSSNet" on (a Convergent MightyFrame). If anyone else plans
on working with this under System V please let me know so we can share
war stories.

I will post an announcement once the new version is available from ncc.

To those who have unsuccessfully tried to uucp the KA9Q Internet Package from uucp host winfree as per the information in the release posting...

I have fixed the problem that caused requests from unknown hosts to fail. Two sites have gotten the bits this afternoon, so I think it's fixed. If you tried before and it bombed, try again now with the same login info!

 The basis behind making people learn Morse code if they want to
 access amateur radio frequencies is the only thing stopping the
 morons who would destroy it by turning it into another CB free
 for all.

 The present code restrictions are quite liberal , and have been

watered down from past requirements.

You can call it elitist,snobbish,or anything else,but CW (morse) is
not a DEAD , outdated medium,and is still damn useful when atmospheric
conditions preclude voice contacts.

You will find droves of hams willing to help you get started with code,
and the small investment of time learning morse is well spent.

I am sorry if I have offended anyone,but these are my opinions.

W3VDU.

This is one of the most absurd comments yet. The problems
with using HAM radio has nothing to do with broadcast datagrams.
HAM Packet Radio can use datagrams addressed to all receivers
when it is appropriate. RWHO packets would fly just as legally
on a ham packet system as on your ethernet (which is not a common
carrier because you own both the sending and receiving stations
and operate the carrier in the middle).

HAM radio can not be a common carrier (i.e. send other peoples)
datagrams around other than the amateurs themselves) because they
convinced the FCC and the other common carriers that they were not
going to compete that way. This is why they are allowed to exist

at all. Otherwise, HAM's would all be down on 27 MHz with everyone
else or would have to fight an even tougher battle than they already
do to maintain their portion of the spectrum from commercial interests.

Having "finished" a debate with megalink's author on Compuserve, I can
add some comments about these protocols. Normally I don't criticize
other file transfer protocols, but I did not care to let false
criticism of YMODEM and ZMODEM by megalink's auhors go unchallenged.

For the record, the fact that my name appears about 9 times in the
latest megalink protocol description does *not* mean I endorse
megalink in any way.

Megalink uses fixed length blocks both for the filename (can't handle
full pathnames) and data blocks. Each 512 byte megalink data block
has a minimum of seven overhead characters. As a result, megalink has
considerable overhead, especially on short files. BTW, the 98.5 %
transfer efficiency "gttutor" reports for an 880k .ARC megalink file
transfer is mathematically impossible.

Megalink does not protect all of the XOX/XOFF and network control
characters that ZMODEM does, so megalink has a theoretical efficiency
advantage over ZMODEM on .ARC files longer than about 20kb. In
practice, ZMODEM's automatic receiver startup and crash recovery
increase the operational efficiency in ways competitive performance

tabluations tend to ignore.

SEAlink uses 128 byte XMODEM style packets with no protection
for flow control or network command characters. A SEAlink receiver
generates an ACK every 128 bytes, impacting throughput on buffered
modems etc.

The only implementations of megalink are those supplied by Meiners
himself. Tests to date show this software to be overly sensitive to
buffer overruns and transmission impairments. Under some conditions,
it is possible to speed up a megalink transfer (as reported by the
transmitter!) by halting the receiving computer at the right instant.

Actually, ZMODEM isn't the fastest file transfer protocol in the
world. YMODEM-g is faster, but its error recovery is worse than
megalink.

ZMODEM is designed to provide user friendliness, high efficiency, and
high reliability in environments that support (or nearly support)
XMODEM. ZMODEM's weakness is a coding complexity greater than XMODEM,
a failing that is more important to Turbo Pascal mavens than to C
hackers and comm software users.

Xref: mnetor rec.ham-radio.packet:509 comp.dcom.modems:931

I beg you to move this discussion away from comp.dcom.modems and
rec.ham-radio.packet. I know this is where the discussion started,
but the S/N ratio w.r.t. the subjects normally covered by these two
groups is growing fast. Further, I think that the general scope
of amateur licensing (and testing) deserves the more broad heading
of rec.ham-radio.

I urge you to move the discussion to rec.ham-radio, which is the place
to which followups to this message are directed. Thanks.

>generates an ACK every 128 bytes, impacting throughput on buffered
>modems etc.

Indeed, SEAlink has no protection for network command sequences or flow
control. Although this does give an efficiency gain, one must set up a
network connection (e.g. PCP) using a script which negotiates with the PAD.

A SEAlink receiver does not necessarily generate an ACK every 128-byte packet.
On high speed connections, the version in SEAdog 4.1 goes into 'overdrive',
which is ACKless. This greatly improves performance using semi half-duplex
modems such as the Telebit Trailblazer.

This is not to say that SEAlink is a robust protocol.

I am pleased to report that through the generosity of a local PC dealer,
my BBS is back online running a slightly damaged ST-238. The KA9Q
TCP/IP package distribution of 870829.0 is now available there for those
of you without any other means of obtaining it.

As a reminder, the bbs can be reached at 303/593-0766, 300/1200/2400 baud,
and first time callers have sufficient privs to download the entire release.

Have fun!

Anybody besides me get in on this? We need a support group! Although I'm not experienced at this, I'll volunteer to put together a mailing list for these machines.

My first impression of the hard disk and the software is very good. (The actual computer hasn't been shipped yet.) Very nice manuals, and GRiD-OS looks superb. (Message-based, with shared, re-entrant user-interface libraries and dynamic device drivers.)

Specifically, I'm looking for a C compiler for GRiD-OS. The "official" one (PN 23032) costs $600, and is not available at the off-lease discount! GRiD-OS looks like just the thing for a packet station manager.

Count me in! I got together a group of us and we bought several systems.
My 1101 came in Friday, about 3 days after the disk combo. I was up until
0230 playing with it. Although GRiDOS is overly menu driven, it makes the
need for the documentation minimal. I have the bubble memory loaded with
the operating system, the VT100 emulator, the word processor, several
VT100 control files and still have 82Kb left (in the bubble). The 2101 disk
combo is a tad too heavy to lug on trips, but with built-in modem works
fine (Hayes compat) and I have been able to dump ascii file to my Unix
system w/o problems. Have not tried it yet under MS-DOS.

Count me in on the mailing list. I will get it to those in my group who
may not be able to get it directly.

Two of us here bought 1101's . I am using it under MS-DOS and the other
guy is using it under GRiD-OS. We are both VERY pleased.

I ordered Turbo-Pascal (MS-DOS version) which should run. I also ordered an
editor (QEDIT) from Sammy Mitchell in Smyrna, GA which has a version that
is ANSI compatible. Slow, but should be useful.

When I get my copy of TPascal I'll be able to convert a comm program to work
on the GRiD.

By the way, GRiD users don't worry when the machine gets very warm. It's
supposed to. They use the case as a heat-sink. (and they call it a LAP top
- Not in MY lap :-))

Let's get the mailing list going!! (<Thanks Jan)

-Owen

Sorry Glenn, I tried but the mail got bounced back to me. Alas, the net
is not perfect. :-)

Here's the original scoop, verbatim.

****

You can get a magnesium cased 135G's shock resistant (operating &
non-operating!) laptop GRiD Compass 1101 with Electroluminescent
flat panel screen (24 x 80 lines, 512 x 256 bit-mapped,
selectable fonts), 256K RAM, 8086/8087, 384K Bubble Memory and
Built-in 1200 Baud modem used for $200. This configuration is
sufficient if you don't push things to the limits (i.e. running
many applications at once with the window system) or just want to
use it as a portable terminal. You can also get a 5-1/4 portable
floppy disk drive to go with it for an added $75, however the
386K Bubble Memory space is sufficient to hold the OS (which is
multi-tasking, MS-DOS 2.11 available as well), two applications
(e.g. Editor and Terminal Emulator) and have about 50K left over
in free space for user data. The GRiD comes with the 'Management
Tool Set' which includes Editor, DataBase, Plotter, SpreadSheet,
Operating System. You'll need to order an emulator if you want
to use it as a terminal. There are three of them: GRiDTerm
(basic glass tty), GRiDVT100 (emulates ANSI VT100), GRiD3101 (IBM
3101).

One company selling these used is USL Data Systems. Contact Dave
Lucas, toll-free number 800-257-6083. The unit comes with a 30

day, overnight express, replacement warranty. Another company offering 1101's (at $175) up to the 'higher end' Compass 1139 (at $900) is Phoenix Leasing of San Rafael, Contact Patti Rossi at 800-772-4021.

GRiD Compass Computers require wall outlet power (110 or 220 selectable); External Battery pack available directly from GRiD model # 31024.

****

There is a mailing list for GRiD owners. Send mail to :

gatech!tektronix!stalker.SPT.TEK.COM!GRiD

to be added to the mailing list. (Is that OK Jan?)

Rumor is the 1139 is going down in price.

Almost, Owen. Actually, to get added to the list, send a request to jans@tekcrl.TEK.COM. The alias GRiD@staller.SPT.TEK.COM is the actual list -- please *do not* send your requests there, or everybody on the list will see it, and phone bills will go up unnecessarily. If your mail system doesn't understand domains, use the path tektronix!tekcrl!jans.

Additional info on the cheap GRiDs -- the 256k boxes make fine portable terminals, and can run simple applications, but spend a bit more for a 512k machine if you want to do any development on it.

Well, it's on the air. Special thanks to Geoff for helping me get some addresses straightened out.

This mailing list is primarily for hobbyist-types who have purchased used GRiD Compass computers, although we won't turn away anyone. To join the group, drop a note to:

jans@tekcrl.TEK.COM (domain style), or
tektronix!tekcrl!jans (path-from-backbone style)

So send a message to the entire group, address the mail to:

GRiD@staller.SPT.TEK.COM (domain style), or
tektronix!tekcrl!staller!GRiD (path-from-backbone style)

As a start (or as initial information, if you are just joining), it might be nice to have the following information. Send it to me, and I'll summarize to the group.

Model(s) of GRiD computers you have:
GRiD-specific peripherals you have:
Primarily GRiD-OS, or MS-DOS user?
Software that you are using:
Primary use of machine(s):
Projects -- special things you want to do with/to your GRiD:

I've heard rumors of a software package written in Europe for the C64 that takes the place of the TNC during packet radio communications. From what I hear, it's in the public domain and serves as the modem and terminal for packet. All that's needed is an interface that costs about $18 in parts. Does anyone know anything about this? Has anyone successfully done this? I'll have access to the software and docs (in the near future), but I'd like to have someone on the net that I could ask questions to if I run into any problems. Any help or information is appreciated. Maybe I can afford packet after all!!

Well, here it comes again, in short form:

    These are 3 year lease returns, that have been fully reconditioned
    (i.e. like new) by GRiD. They are in limited supply, and some
    may be sold out already. Persons to contact:

        Patti Rossi @ Phoenix Leasing
            (800) 227-2626 (national)
            (800) 772 4021 (california)
            (415) 485-4500

    Prices ran from $175 to $900. Lower cost units are sold out.

 Kurt Reisler (703) 359-6100

The Amateur Packet Radio Network (AMPRNet) is a global network created
for radio amateurs experimenting with packet radio communications using
the DOD IP protocol. This network is part of the "Internet", and has a
block of addresses reserved for it's nodes. From this master block,
smaller blocks are allocated on a demand basis to individual countries.

Several of us in the Edmonton area were interested in using Phil's code,
and requested some addresses. In the process of getting them, I got a
new job - that job being the AMPRNet address coordinator for Canada.

Therefore, if you are using Phil's code (or are planing to in the near
future), or if you know of other hams who are, please contact me so
that an AMPRNet address can be assigned to your station. I would also
appreciate it if this message could be passed along to the local clubs
and various nets.

You should also join the tcp-group mailing list, where the software
is actively discussed. Send a request to sdcsvax!tcp-group-request.

Copies of Phil's code are available from here via anonymous UUCP.
Take a copy of ncc!~/pub/ka9q_all.tar.Z using one of the following
L.sys entries:

ncc Any ACU 2400 14034250342 "" \r ogin:--ogin: nuucp
ncc Any ACU 1200 14034250342 "" BREAK ogin:--ogin: nuucp

Don't ask for a copy to be mailed to you - it's too big (534378 bytes).

I have a Pacomm TNC220 on which I want to run KISS and thence the KA9Q
tcp/ip package. Unfortunately I don't have a KISS for the TNC.
Can anybody help. I would prefer the co-resident bootstrap with a
downloaded KISS module if possible.
ta Gareth

          The Radio Amateur Telecommuications Society
                    Information Bulletin

              COSI-Switch Update: 13 December 1987

* Well December is here we're on track ! As stated in our last update we are running a few weeks behind, but we haven't gotten any more behind than before !

* Tom, W2VY has the code in the initial Z-80 target machine (TNC-2) and has begun the debugging process. He has previously completed an exhaustive set of software and protocol tests on a PC and on a Z-80 based CP/M machine. The protocol tests, test the whole system with the exception of the drivers. The early versions of the test environment were loaded to CompuServe and are available there.

* Beta Testing will begin this month (December).

* The RATS COSI-Switch by Thomas A. Moulton, W2VY will be released (mailed, uploaded, etc) with source in late January. Target machines for this release include the TNC-2 family and PAC-COMM's DR-200 and PC-100. Other targets are being examined...feel free to suggest a favorite !

* RATS is expecting the arrival of a beta test PC-186 board. The RATS COSI-Switch will be ported to this device, providing a vehicle for high speed (greater than 56KBps) links.

* The COSI-Switch software has been requested by groups in 33+ states and 15+ countries !

* The back to back multi-TNC node configurations will be supported for those who wish to change their node software. PLEASE NOTE: This was requested by YOU, the folks who expressed a desire run software with available source code.

* There have been some questions about our distribution and use policies. Our software policy is simple:

    1. Free for non-commercial Amateur Radio use ONLY,
    2. Modification policy for non-commercial Amateur Radio users is simple,
    3. Executable, source and modification licenses can be obtained for other uses.

  Software modification policy for non-commercial Amateur Radio users: You can modify the code all you want, but in order to maintain your right to use the code you must send us copies of your modified software source. This ensures that the distribution of new features added by others is consistent. It also helps us ferret out bug reports from the field.

******* PLEASE NOTE: ALL PROCEEDS GO TOWARD NETWORK COMPONENTS ********
NO CONVENTION TRAVEL FROM THIS FUND !

* Here is a description of some of the features

*** AS IMPLEMENTED in the SWITCH TODAY.

USER CAPABILITIES

The interface to the COSI-Switch has been designed with the average user in mind. Current users are familiar with networking using digipeaters (C CALLSIGN VIA DIGI, DIGI). We have continued this basic concept in the COSI user interface. There are several different ways the user can access the switch and, through it, the network.

Local Digipeating

This mode of operation is pretty straightforward and provides a familiar mode of operation to continue WITHIN the local network. The COSI-Switch will ONLY digipeat frames with just one callsign (its own) in the "via" field of the AX.25 frame.

Within the local network, users may digipeat through the switch by typing:

"C N2FWI V N2DSY-3"

Multi-Switch Networking

There is only one new concept for users to learn in order to use the advanced, multi-switch networking capabilities of the COSI-Switch. Each switch has a unique, 6-digit "address." This address is made up of two parts: the telephone area code serving the switch's location (first three digits), and a three digit Switch Number.

In order to connect to another station at a remote switch one must know the address for that switch. If KB7UV uses the switch "718010" then to connect to him a user would type:

"C KB7UV V N2DSY-3,718010"

The call request will be routed TRANSPARENTLY to the destination switch and user.

Local Switching

There is however another option: a user may want to use the advanced functionality of the switch WITHIN the local network. This is just like a multi-switch connection except the Destination Switch Address is that of Source Switch! To do this type:

"C N2FWI V N2DSY-3,201010"

This initially looks like a two hop digipeater connection, but in reality the COSI-Switch gets into the picture and make the connection more reliable. The COSI-Switch will receive the request from W2XYZ and then send a connect to N2FWI. After this connection is established the switch will acknowledge the initial connect request. If required, the N2DSY-3 switch will retransmit frames that are unacknowledged. The switch will use its own parameters to determine the need and ideal opportunity to retransmit. The switch will not only automatically determine the port used by "known" users, but will search out the "unknown" user on its user ports.

Network Management

After examining the trends of the last few years, we have determined that most switches, digipeaters and other devices seem to be fairly stable. We have chosen to build on this and plan our network implementation philosophy on the premise that inter-switch trunks will be planned and preconfigured. This reduces the need to endlessly tie-up precious bandwidth with automatic reconfiguration tables. This also has the additional advantage of preventing renegade nodes from appearing and jeopardizing the operational effectiveness of the backbone. This brings up two points:

1. How will the COSI-Switches be managed ?

The COSI-Switch when released, will contain a remote configuration and statistics module. This system will have a security mechanism. Another capability of the COSI-Switch is the generation of "connection records". These provide an record for the COSI-Switch owner/trustee of the source, and destination calls and network addresses, access digipeater path (if any), the time and whether the record is a call or a clear record. The clear records will also contain the clearing cause and diagnostic code. These are valuable items which aid in the network configuration process. They are also useful when attempting to track down the source of undesirable activity.

2. How will temporary COSI-Switches be added in times of emergency when a stricken area requires supplemental communications ?

A COSI-Switch may be added to the network at any time. The new switch located in the stricken area would appear as a Level 3 user. Calls would be routed out by the new switch and through any switches attached to it. Inbound calls would not be routed into the stricken area until, or unless the new switch is added to the tables of the existing switches. This is an IDEAL situation since emergency traffic should flow outbound from the stricken area, until the situation has stablized. The remote configuration feature can be used to integrate the new switch into the network if the situation requires.

The procedure and format of the remote configuration are currently being finalized.

Addressing Plan
---------- ----
The Level 2 user can be found in the network by routing on the destination user's callsign and the destination node address. A short form entry mechanism has been provided for Level 2 TNC users. This is the six digit switch number made up of the telephone area code and switch number. This is a part of a larger (20+ character) address. Don't expect us to ask you the users to type in all this, but if you wish to have full interworking between networks (Amateur and others) then you might want the option for some connections. We'll talk about this in further bulletins. Here's a brief overview to get you started.

The addressing plan used by the COSI-Switches is based on the OSI NSAP Address (Open Systems Interconnection - Network Service Access Point). This address contains two components: the callsign of the station and the COSI-Switch Address. The NSAP takes the form: Prefix + callsign + Data Country Code + Number
The Prefix is determined jointly by CCITT and ISO. It functions to identify the portion of the addressing plan that we are using. The next field contains the Amateur callsign.
The last two field identify the country of operation and the switch address. Specific plans for national use outside of North America will be developed. Consultation with RATS is suggested so that we can include such plans in our documentation.

Final Note
----- ----
We will be circulating switch software to the beta group later in the month and general distribution will be in late January. Despite some recent questions about commercial systems, we are investigating through letter the possibility of distributing the COSI-Switch software via CompuServe. Planned channels are via telephone BBS, UUCP, US Mail, and Amateur Packet Networks Look for it.

Summary: out of luck

Having spoken with PAC-COMM on this subject, I have bad news for you.
Because the 220 is not a TNC-1 or TNC-2 clone but a complete redesign
by PAC-COMM the existing KISS PROMs won't work and no one that PAC-COMM
is aware of has written KISS for the 220 specificly.

I know it is hardly comforting but the best solution I can think of is
to purchase another TNC for just running KISS and TCP-IP. Again PAC-COMM
has a new product called the TINY-2 which is a reduced size TNC-2 imitator.
It does use the normal TNC-2 PROM so you can put in one of the existing
KISS implementations.

Good luck.

P.S. If anyone can prove me wrong please do as I have a TNC220 also and
would love to be able to run KISS in it as well as my KANTRONICS!!!

I just want to add that you will notice that the addressing described
for COSI referenced Area Code and Switch number, Gordon and I fought
over this a bit.

Why?

Everything listed is CODED AND WORKING unless otherwise stated.
We will be using Area Codes and Exchanges in future releases but I was
very firm on having the update notice reflect REALITY not what we want to
have in for the first release. It's just a matter of coding to get the ideal
things in place.

The beta release will use switch numbers, I HOPE to have exchanges in for the
offical release in Jan.

hi ho hi ho it's off to code we go...

I'm not sure what you meant by the reference to Kantronics, but they now support SLIP on all their TNCs. They advertise it as "TCP/IP compatibility". I appreciate the plug, but "KISS compatibility" would have been more accurate and descriptive.

I've been offered a Tandy 2000 with 20 mb hard drive for a give-away price, and am not about to let it go...unless I find that it doesn't work!

I'd like to use it to run a packet radio bulletin board, but am afraid that the 2000 is not compatible enough...specifically that the serial ports are non-standard (interrupts et al).

Can anyone tell me more about the machine and what I may (or may) not be getting myself into! Please E-mail your responses...

Thanks

*** This is the one you've been waiting for! ***
*** MERRY CHRISTMAS !! ***

Announcing an update to the KA9Q TCP/IP software package release of 870829.0, bringing the current release date up to 871225.0. This update is a *MAJOR LEAGUE* revision. If you're running 870829 or earlier, update *now*.

The changes:

There have been so many dramatic changes that I am going to dispense with my normal level of detail and just hit the high spots. You've got to use it to believe it!

- Parameters to the param command are now in DECIMAL, *not* HEX. Make sure you update your AUTOEXEC.NET files!

- I HAVE MOVED! *PLEASE* make sure you read the new phone numbers listed below, and update any dialer scripts as required...

- a fix to the TNC-1 KISS from Marc Kaufman.

- complete support for AX.25 level 2 connected mode, including both the ability to have level 2 connections as a session type, and the ability to push IP datagrams across connected-mode links. This portion of the package is based on work done by Jon Bloom, KE3Z, hacked wildly by Phil KA9Q. Yes, this means you can run KISS TNC 24 hrs/day, and still talk to your local PBBS!

- support for the Mac and Amiga by Mikel Matthews. The binaries are provided uuencoded for the Amiga, and in BinHex format for the Mac. The binaries are slightly out of sync with the sources, and sport a different version number. They'll do for now though... until we re-sync with Mikel, you're on your own with the sources.

- support for System 5 Unix by Jere Sandidge

- major enhancements to the SMTP modules and the BM mail user interface by Dave Trulli, NN2Z.

- a newly integrated, all-in-one manual by yours truly, based heavily

on the previously available documents, but with considerable updating and integration. This one's still a preliminary, comments and criticisms are welcome...

- the ability to record Telnet and AX.25 connected mode sessions in a file.

- the ability to do an ASCII text "upload" of a file to a Telnet or AX.25 session.

- considerable modification of the command interpreter. You'll need to study the sample configuration files supplied, and update accordingly.

- an update to the PBBS/SMTP gateway software by WA3PXX. This has *not* been tested with the latest BM, but we don't *think* there will be any problems. Let us know if there are!

- a driver for the Eagle I/O card based on the Zilog 8530.

- other things I've surely forgotten...

Things that are on the burners:

- a driver for the PC-100 card from PacComm
- improvement of the new user manual

What to do once you have software, aka "getting an IP address":

Users of this software package become part of the "global IP internet", and as such need to obtain unique IP address assignments for each host they plan to put on the air, or "on the wire". Major metropolitan areas in the US, and countries with active TCP-using groups probably already have blocks of addresses in amateur radio 44.X.X.X block assigned to them. Ask around locally before you go any further.

If there is no local address block in your area, and/or noone is coordinating address assignments for your local net, contact Wally Linstruth WA6JPR. Wally is the global top-level address administrator for the ham radio 44.X.X.X subnet. Wally may be reached by email at

wally%net1.ucsd.edu@sdcsvax.ucsd.edu
or wally@net1.ucsd.edu
or ...!sdcsvax!net1!wally

or via the new forwarding mechanism I have set up for those sites who know how to reply via mail to this message, but can't reach Wally's machine directly:

winfree!wally -or- wally@winfree.uucp
or wally%winfree.uucp@flash.bellcore.com

How to obtain the KA9Q Internet software:

- Direct UUCP connection to winfree is available to those who request it for polling to get new versions. Inquire via mail to one of the addresses below. Anonymous uucp is available. The phone number is 303/495-0492, 300/1200/2400 baud, 24 hrs/day. A typical L.sys entry might be

  winfree Any ACU 2400 13034950492 ogin: Uanon word: notFTP

  Start by grabbing the file /usr/spool/uucppublic/pub/README, which contains info about what is available. A possible uucp command ala BSD might be:

  uucp winfree!~/pub/README /usr/spool/uucppublic

- Via Opus, log in to my BBS and download from the appropriate files area. There are several .ARC files for the full distribution, one for each of the directories.

  I have configured my BBS to allow first time users ample resources to download the full distribtuion at 1200 baud. The phone number is 303/495-2061.

  If you have any trouble downloading from the BBS, please let me know. Speeds that are supported include 300, 1200, and 2400.

- TAPR, the Tucson Amateur Packet Radio association, has agreed to make copies of the software available on PC floppies. They can also provide programmed EPROM parts for the TNC-1 and TNC-2 that include the KISS protocol software.

  TAPR
  Box 22888
  Tucson, AZ 85734
  USA
  (602) 746-1166

  DISKETTES: All diskette software is IBM PC DOS 2.0 or later format, on 5 1/4" diskettes. Please send a return mailer with postage and $2 for copying. If you desire TAPR to provide the diskettes, the charge is $1 for mailer and postage, then add $0.75 per diskette

  o TCP/IP (KA9Q) (3 diskettes)
  o Intro to TCP/IP (2 diskettes)
  o TNC 1 Source Code (1 diskette)

  EPROMS: We will program your EPROM(s) for $2 per TNC-worth plus a prepaid return mailer. If you choose to buy EPROMS from TAPR, we will include the mailer and postage in the purchase price of the blank EPROM.

TNC2 release 1.1.4 requires 32k RAM in your TNC2. If you haven't already upgraded, 32k RAM chips are available from TAPR for $20 postpaid. Current blank EPROM prices are $10 for 27C256 and $5 for 2764 (may be 27C64, depends on availability).

TNC2 1.1.4 includes documentation.

o TNC 1 KISS (2764)
o TNC 2 KISS (27C256)
o TNC 2 1.1.4 w/loader (27C256)
o TNC 2 1.1.4 w/kiss (27C256)

(I suggest that foreign shipping addressees include sufficient postage to assure airmail delivery, if you don't know the rates add about $1 per disk or EPROM).

*** late breaking news: TAPR is now shipping 1.1.5! No other info is available. Substitute 1.1.5 everywhere you see 1.1.4 in this section?

- On the Internet: The bits will show up in a few days on SIMTEL20.ARPA in the directory PD:<MSDOS.PACKET>. Watch for a further announcement when we can get the bits updated there.

Unreleased (read: under development) versions are often available on louie.udel.edu in the pub/ka9q directory, caveat emptor...

If anyone has any trouble getting hold of a copy of the code, please let me know!

Organization: Princeton University, NJ
Lines: 25
Keywords: TCP/IP KA9Q TurboC

Hello,

I have received a number of requests for the Turbo C port of the KA9Q
TCP/IP code. I have been mailing it out but now I am swamped. I thought
that only a few people would be interested in the code when I made the
offer to mail out copies. I shall therefore post the stuff to the net.

I would like to warn everybody that the version I have ported is NOT the
Christmas release. I am not using it for a packet radio, in fact I am
only using things to the socket level and so I have no plans to port the
Christmas release either. Also since I am not using most of the features
I have not tested them extensively. I am reasonably certain everthing
works over the ethernet with the 3COM board (I have used that portion),
but the rest I know that it compiles - I have fixed all the problems
that cropped in the ethernet portion and fixed similar code in other
places similarly.

My apologies to those people who requested and had to wait and then get
this message. I'll probably post to comp.protocols.tcp-ip.ibmpc unless I
get messages to the contrary soon.

Lines: 48
Keywords: unbelievably rude

There is an interesting bug in the latest version of Desqview. Apparently DV doesn't do a very good job of keeping track of console "RAW" mode status. Sometimes a program is started in raw mode that shouldn't be, and other times you can't get DV's console driver to go *into* raw mode when you need to. The upshot is, there are some very simple, well-behaved programs that don't work right under Desqview (one of the them is the BM mail program used by amateur radio tcp/ip'ers).

Fool that I am, I thought Quarterdeck might be interested in fixing this bug. For all I know, their technical people might be, if there were any way to reach them. Quarterdeck is one of those companies who apparently hired psychologists to tell them how to discourage people from ever, ever bothering them for service.

I've been trying to call them on their non-toll-free number for about a week, and getting constant busy signals. Finally today I reached their telephone answering person. She put me on hold for tech support, and for the next 20 minutes I was treated to a rather expensive conversation with their computerized telephone system. Finally I accidentally failed to push the proper combination of keys to stay on hold, and was zapped back to the telephone answering person, losing my place in the queue. Exasperated, I explained that I didn't need help installing the program or running Dbase; that I was a software developer and wanted to report a real, live bug. I was put through to a sales manager. She listened politely while I explained my problem, then immediately zapped me back to the telephone answering person, who said, "Please hold for tech support."

"Wait a sec," said I. "Does this mean you put me back on the end of the queue, and I spend *another* twenty minutes talking to your phone system?"

"I guess so," she answered. At this, I became a bit upset. "Look, I have spent a lot of money on this call, to be put back at the end of the queue. I don't need help installing the stupid program. It has a bug, and I'm trying to report it."

"It seems," she answered in a *very* snide voice, "that *everyone* who calls us has a bug." Well, this was the last straw. I demanded to talk to the president's secretary. "You wouldn't be permitted to do that," she said. When I began sputtering something in return, she said, "I'm going to put you on hold until you calm down." *click*. I tried to call back, but of course, I got a busy signal.

I've heard people say that, for example, Microsoft has bad customer service. Microsoft may not be great, but I have never, ever been treated like this by them, or for that matter any other software company before. For all I know, Quarterdeck has *no* support people at all, and simply abuses their customers until they give up. Can anyone top this?

The topic of license-free packet radio has been floating around for
some time. Several ideas have come and gone, including the 52-54 MHz
"reallocation" and the use of 49 MHz license free bands.

Why not class D CB (27 MHz)...

The power limit on this band is sufficient to set up a reasonable
packet network (i.e. doesn't require lots of close-together low-power nodes).

The radios are cheap (<$60) and come with simple speaker and microphone
connectors, suitable for connecting a comercially available TNC.

The bandwidth available is sufficient to support at least the 300 baud
HF modem standard, and almost certainly will also support the standard
VHF 1200 baud (202) standard.

The channels already exist and, even better, already sound as bad as
packet channels would to voice users.

Contrary to popular belief, packet WILL work on AM. In fact, it may
work better than voice on the same channel, because heterodynes
with existing carriers are usually NOT within the modem filter bandpass.

A reasonable license-free packet network seems to be needed, and,
setting it up on existing personal radio channels would alleviate
complaints from users of other spectrum space (such as amateurs)

that would otherwise be reallocated to provide for such a service.

The only restriction that currently exists is FCC Part 95.627
which states that:
d) Digital emmissions are not permitted in the GMRS or the CB radio service.
e) The transmission of data is prohibited in the Personal Radio Services.

I am interested in finding out what other opinions exist regarding
the expansion of CB to include digital packet radio. Certainly if
enough people are interested, the FCC can be persuaded to modify
these existing regulations.

Please indicate your opinion by posting, or by e-mail.

Thanks,
Matthew Kaufman

   I don't know just what the present status of the Class C frequencies

are, but they are definitely available for digital communication. I
don't know if this is limited to remote control applications or not,
but it might be possible to consider a packet radio installation as
a remote control device (hook it up to a BSR X-10, etc... :-)).

I use CB extensively. I do not have my ticket yet, but do hope to in
the future. I would really like to see a packet allowed on 27 mhz.
I started a radio club awhile ago, we are very interested in packet, ham
and other radio aspects, however, the money and living conditions limit
most of the members from moving on. A license free packet operation would
for sure get more people started.

My vote is yes, and I can say that so is the vote of our radio club.

  I've heard this too. I believe it is true. The peak should start
somewhere around 1991. This is also the time when California is suppose
to have another predicted drought. Which makes sense because the last
highest CB activity was from 1976 to 1978 and this was the years
when California had its drought. I know that the time interval from
the last skip activity to 1991 is not 40 years, but what was experienced in
1976 to 1978 was a shorter skip cycle. (~10 years) From my observations,
CB also experiences a smaller scip cycle around 23 days (around there)

 The skip activity during 1976 - 1978 from what I've been told by people
was great, but made talking local impossible. The conditions during those
years made many people interested in CB, but also forced a lot of people
to stop using radios. So, I'm guessing that around 1991 the skip conditions
will be better on CB than 1976-1978, but they will also force many people
off the radio.

 Presently on 27 mhz the skip is rolling in. This fits with the 23 day
summer type day cycle. (warm afternoons, lots of sun). It has been this
way for about 4 days. From Northern California people from the east coast are
easily heard in the morining through 5pm, then people from the southern
western states and Canada our heard, and at around 6:30 Hawaii and Australia
are heard for only about 30 to 40 minutes. And around 7:00 or 7:300 the
airwaves are dead.

 This experimenting was done on Side band using a 3 beamed yagi, horizontal.

>"reallocation" and the use of 49 MHz license free bands.
 The 1st of which will happen on a cold day in HELL, the second is not a
useful option due to the range of the devices available and...
>Why not class D CB (27 MHz)...
..this suggestion, while it might seem reasonable is actually not. Some of
us have tried this and while it *does* work, the amount of hate 'n' discontent
it generates would not endear such packet users to the rest of the CB community!
>The power limit on this band is sufficient to set up a reasonable
>packet network (i.e. doesn't require lots of close-together low-power nodes).
 The power "limits" are seldom enforced, and you will find that in metropolitian
areas like L.A. and such, seldom observed. I.E.-noone will hear you @ 5 w.
>The radios are cheap (<$60) and come with simple speaker and microphone
>connectors, suitable for connecting a comercially available TNC.
 With good reason, the radios are not very selective and have little in the
way of sensitivity. FM would be better, but F3E is illegal on 11 meters.
>The bandwidth available is sufficient to support at least the 300 baud
>HF modem standard, and almost certainly will also support the standard
>VHF 1200 baud (202) standard.
 1200 works fine on a clear channel, AM or SSB. On a crowded channel only
SSB will get your packets across without a very large number of retrys.
>The channels already exist and, even better, already sound as bad as
>packet channels would to voice users.
 No comment.
>Contrary to popular belief, packet WILL work on AM. In fact, it may
>work better than voice on the same channel, because heterodynes
>with existing carriers are usually NOT within the modem filter bandpass.
 Yes, it will work, but the hetrodynes cause retries, many retries.
>A reasonable license-free packet network seems to be needed, and,
>setting it up on existing personal radio channels would alleviate
>complaints from users of other spectrum space (such as amateurs)
>that would otherwise be reallocated to provide for such a service.
 Oh phooey! Stop sniveling, and go study a little! The Novice ticket is
well within the reach of anyone who wants it. There are Amateur Radio Clubs
around that will bendover backwards to assist you in doing so.
>The only restriction that currently exists is FCC Part 95.627
>which states that:
>d) Digital emmissions are not permitted in the GMRS or the CB radio service.
>e) The transmission of data is prohibited in the Personal Radio Services.

And with good reason! Study packet a little closer and you will notice that improperly used, packet can cause a tremendous amount of interference. The use of such equipment by completly untrained users would be difficult to actually justify on the International level. Everything the FCC does is fuel for those that participate at the WARC's..you're asking for blood.
>I am interested in finding out what other opinions exist regarding
>the expansion of CB to include digital packet radio. Certainly if

The Amateur community stands ready to welcome you and all others as fellow operators...anytime you are ready to get serious. The expansion of CB radio, is something the FCC will only laugh at. It's been proposed several times. Some of the proposals have included such things as:

A) Expansion of class D 11 meter CB from 27.405Mhz to 27.995. mixed modes.
B) 27.410-27.510 A3J voice, F3E voice 27.515-27.715 and AX25a Packet only from 27.720-27.995 using F2/3/E.
C) A new class of service, from 27.410-27.510, for AX25a Packet only, using F2/3E. (i.e. "CB Packet" but with a license!)

As an Amateur, I can tell you that the majority of such schemes will *NEVER* garner a shred of support from the Amateur ranks because of the attitude that exists on CB. Look at the hassle that SSB users get/give to/from the AM users. Better still is the use of the "funny freqs"...there must be 40-50 times a week in L.A. that someone figures that since they don't "hear" anyone using the region between 28.0 and 28.2, that it's ok for them to have a nice FM QSO with their Trucker-buddies on their 'Rangers'...number 1: Most of these jerks don't know the difference between CW and fly-to-the-moon. The fact that some of us are indeed having a CW-QSO on 28.150 (right where they fire-up!) is of no interest to them, after all, they bought the radio! It *CAME* with the frequencies! Therefore... number 2: The number of existing radios that are equipped with A.M.-only...bad news is most CB users hate SSB, because they dont have it..more 'Low-buck mentality'. I would favor Frequency expansion (ala item B) if:

1) the radios were equipped in such a way that no firther expansion of the frequency range were possible. Use a rom-based composite PLL/VCO chip that has NO equal for replacement, MANDATE unusual I.F. freqs and no "extra" lines to play with. Make that sucker 99.9% impossible to expand! Cast the boards in epoxy or something like that.

2) the stations were Registered/Licensed. Nothing expensive, just a simple form which insures a better attitude by the users of the frequencies, and a unique callsign identifier for your packet-headers.

3) That the FCC could have an enforcement budget to police violators. Like: a) The LIDS that decide to play music, curse or jam. b) The 'LinearLids', who think 1Kw operation is "cool". c) The jokers who insist on running out-of-band, mixed mode, or who refuse identify their stations. d) The clowns that modify CB gear to encroach on the Amateur 10 meter band. Send these guys to jail for 10+ years!

>enough people are interested, the FCC can be persuaded to modify these existing regulations.

Don't count on it! Amateur Radio is what it is because everyone involved has a vested interest in keeping the 'GoodBuddy' types from overrunning the bands, the FCC's enforcement budget is almost nil, expansion that does not provide for the safeguards listed above has no chance. Period. You want more? CB radio is a sewer, the majority of CB users are braindead, burntout Kids that have so little to do with their miserable lives they congragate around the 11 meter band hoping for any kind of amusement. Just try cleaning it up, I did. I managed to interest 7 people to UPGRADE to Novice tickets..you can do the same.

In a late move the FCC announced that United Parcel Service is trying to re-open the reply period for comments on NPRM 87-14. It seems that someone has sold U P S on the idea of an A.C.S.B. truck-truck radio system in the 215-222 MHz band. In other words, they were sold a bill of goods and are trying to save themselves. If the period for reply is re-opened, (which was closed 6 months ago), then this set a precedent for further openings-closings-openings-closings...etc. This could cause havic in the ranks for this and all other NPRMs relating to ham radio !!!

As a course of action, please write to the commission asking them not to allow comments by UPS in for consideration. Also, for all you people who

mail order equipment of any kind, PLEASE DO NOT ALLOW THE SALES PEOPLE TO SHIP VIA UPS !!!! USE U.S MAIL, FEDERAL, FLYING TIGERS.....ETC. Maybe this will help just a little. 73

 Why not look at the ARRL Long Range Prediction charts? Real Radio Scientists have spent years developing this stuff, it might surprise you..and BTW most of the rumor-legends of CB are vaporware, this is another case of same.

> This experimenting was done on Side band using a 3 beamed yagi, horizontal.

 "Side band"??? "a 3 beamed yagi, horizontal"?? Would you mind explaining these strange terms? Yagi's *are* beams. Some have 3 elements...these are the kind of communication problems that prevail in the 27 Mhz universe..
..my suggestion, Mr. Tulley, is to actually concentrate on learning the real terminology, then some basic theory. If you've got any time left, try some Morse code practice. If you're very lucky, you might just pass your Novice ticket - but not if you insist on clinging to this CB folklore like a security blanket! Give it up! It's worthless. As far as Packet on CB goes, read my posting to that other technotwit on 'sci.electronics', there isn't a snowball's chance in Hell that the FCC will grant *ANY* additional freqs or perks to the 11 meter crowd, so grow up! Get into real radio...
